1) We are given $xy^3 = 80$
and that $\frac{dy}{dt} = -0.8$ ft/sec when $y = 10$ ft

And we want $\frac{dx}{dt}$ when $y = 10$ ft

Use implicit differentiation:

$$xy^3 = 80$$

$$\Rightarrow \frac{dx}{dt} y^3 + 3y^2 \frac{dy}{dt} \cdot x = 0$$

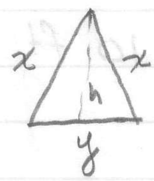
$$\Rightarrow \frac{dx}{dt} = \frac{-3y^2 x \frac{dy}{dt}}{y^3}$$

when $y = 10$, $x = \frac{80}{10^3} = .08$

$$\Rightarrow \frac{dx}{dt} = \frac{-3(.08)(-.8)}{10} = .019 \text{ ft/s}$$

2)

$$2x + y = p \implies x = \frac{p-y}{2}$$



Area $= A = \frac{1}{2} b h$

see that by Pythagoras

$$h = \sqrt{x^2 - \left(\frac{y}{2}\right)^2}$$

$$\implies \text{Area} = \frac{1}{2} y \sqrt{x^2 - \left(\frac{y}{2}\right)^2}$$

now substitute in for x:

$$A(y) = \frac{1}{2} y \sqrt{\left(\frac{p-y}{2}\right)^2 - \left(\frac{y}{2}\right)^2}$$
$$= \frac{1}{2} y \sqrt{\frac{p^2 - 2py + y^2 - y^2}{4}}$$

$$A(y) = \frac{1}{4} y \sqrt{p^2 - 2py}$$

$$A'(y) = \frac{1}{4}\sqrt{p^2-2py} + \frac{\frac{1}{4} y}{\sqrt{p^2-2py}} \cdot (-2p) \cdot \frac{1}{2}$$

now set this equal to zero and multiply by $4\sqrt{p^2-2py}$:

$$\implies p^2 - 2py - py = 0$$
$$\implies p - 3y = 0$$
$$\implies y = \frac{1}{3} p$$

Since the endpoints of the interval give $A = 0$ ft^2 (minima), we see that $y = x = \frac{1}{3} p$ gives the maximal area.

3) $f(x) = \dfrac{x^2 + 5x + 4}{x}$

First, examine limits: $\lim_{x \to \infty} f(x) = +\infty$, $\lim_{x \to -\infty} f(x) = -\infty$

also, we see that we have a vertical asymtote at $x = 0$, and $\lim_{x \to 0^+} = +\infty$, $\lim_{x \to 0^-} = -\infty$

Also, see that $f(x) = \dfrac{(x+4)(x+1)}{x}$

$\Rightarrow f(x) = 0$ for $x = -1, -4$, so we have the only roots at these points.

$$f'(x) = \frac{x(2x+5) - (x^2+5x+4)}{x^2} = \frac{2x^2 + 5x - x^2 - 5x - 4}{x^2}$$

$$= \frac{x^2-4}{x^2}$$

And we see $f'(x) = 0$ for $x = \pm 2$

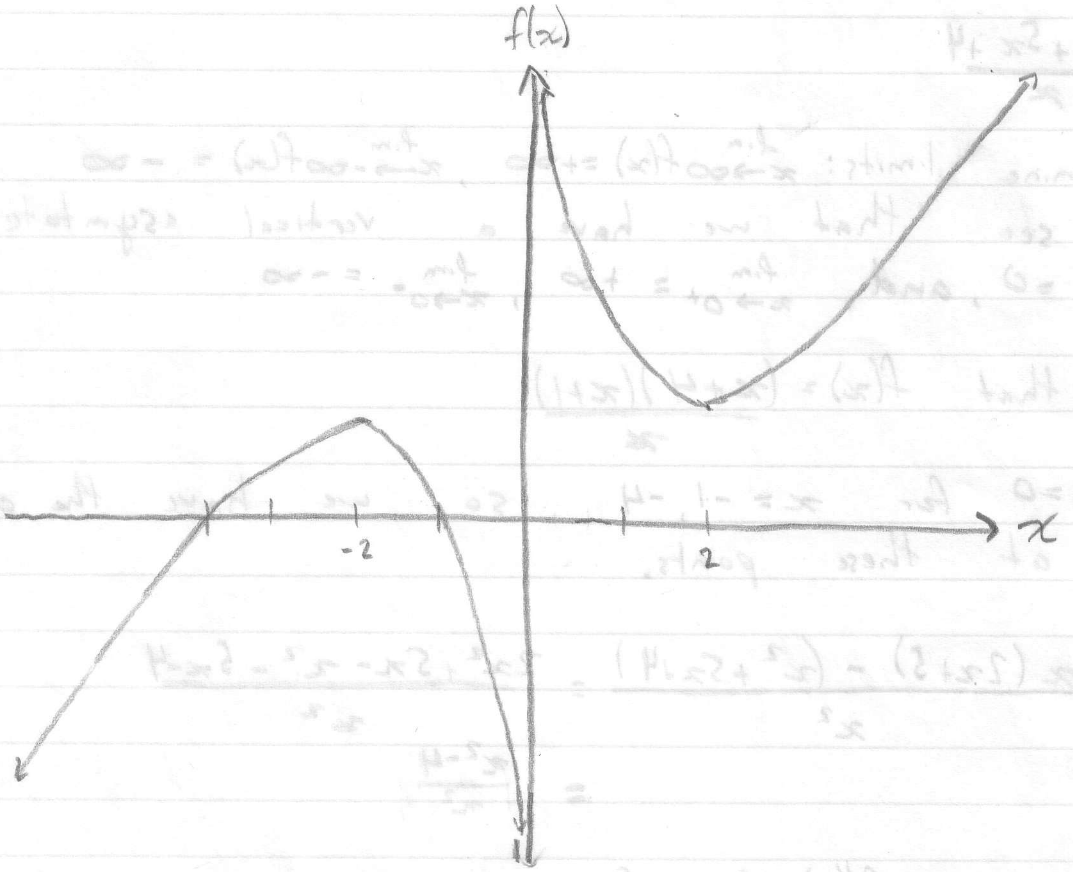
and since $f'(x) = \dfrac{x^2-4}{x^2} = 1 - \dfrac{4}{x^2}$

$$\Rightarrow f''(x) = -2 \cdot (-4) \cdot x^{-3} = \frac{8}{x^3}$$

and so $f''(x) < 0$ for $x < 0$
and $f''(x) > 0$ for $x > 0$

so f is concave down on $(-\infty, 0)$
and f is concave up on $(0, \infty)$

So now we can graph it!



f(x)
x
-2

(4) $f(x) = \dfrac{1}{1-e^x \sin 5x}$; $f'(x) = \dfrac{-(-e^x \cos 5x \cdot 5)}{(1-e^x \sin 5x)^2}$ $\dfrac{5e^x \cos 5x}{(1-e^x \sin 5x)}$

a) linear approximation around zero:

$$f(x) \approx f(0) + x \cdot f'(0)$$

$$f(0) = \frac{1}{1-1\cdot 0} = 1$$

$$f'(0) = \frac{5\cdot 1 \cdot \cos 0}{(1-1.\sin 0)^2} = 5$$

$$\therefore f(x) \approx 1+5x$$

b) $f(0.03) \approx 1+5\times 0.03$

≈ 1.15

⑤ a) $V = \int_0^t a\,dt + V_0$; $V_0 = 0$

$= \int_0^t \frac{t}{10}\,dt = \frac{t^2}{20}$ for $0 \le t \le 20$

$V_{20} = 20$

$V = \int_{20}^t a\,dt + V_{20}$; $V_{20} = 20$

$= \int_{20}^t 2\,dt + V_{20} = \left[2t\right]_{20}^t + 20$

$= 2t - 20$ for $20 \le t \le 40$

$\therefore V(30) = 60 - 20 = 40$ ft/sec²

b) s = distance

$s = \int_0^{30} v\,dt = \int_0^{20} \frac{t^2}{20}\,dt + \int_{20}^{30} 2t - 20\,dt$

$= \left[\frac{t^3}{60}\right]_0^{20} + \left[t^2 - 20t\right]_{20}^{30}$

$= \frac{8000}{60} + 900 - 600 + 400 - 400$

$= 433$ m.

⑥ a) $M = \int_0^{40} D(t)\, dt$

$$= \int_0^{20} D(t)\, dt + \int_{20}^{40} D(t)\, dt$$

$$= \int_0^{20} \frac{t}{10}\, dt + \int_{20}^{40} 2\, dt$$

$$= \left[\frac{t^2}{20}\right]_0^{20} + \left[2t\right]_{20}^{40}$$

$$= \frac{400}{20} + 2 \cdot 40 + (-2) \cdot 20$$

$M = 60$ kg

b) d = average density ; T = total length

$$d = \frac{M}{T} = \frac{60}{40} = 1.5 \text{ kg/m}$$
