Part II: integration, integral theorems

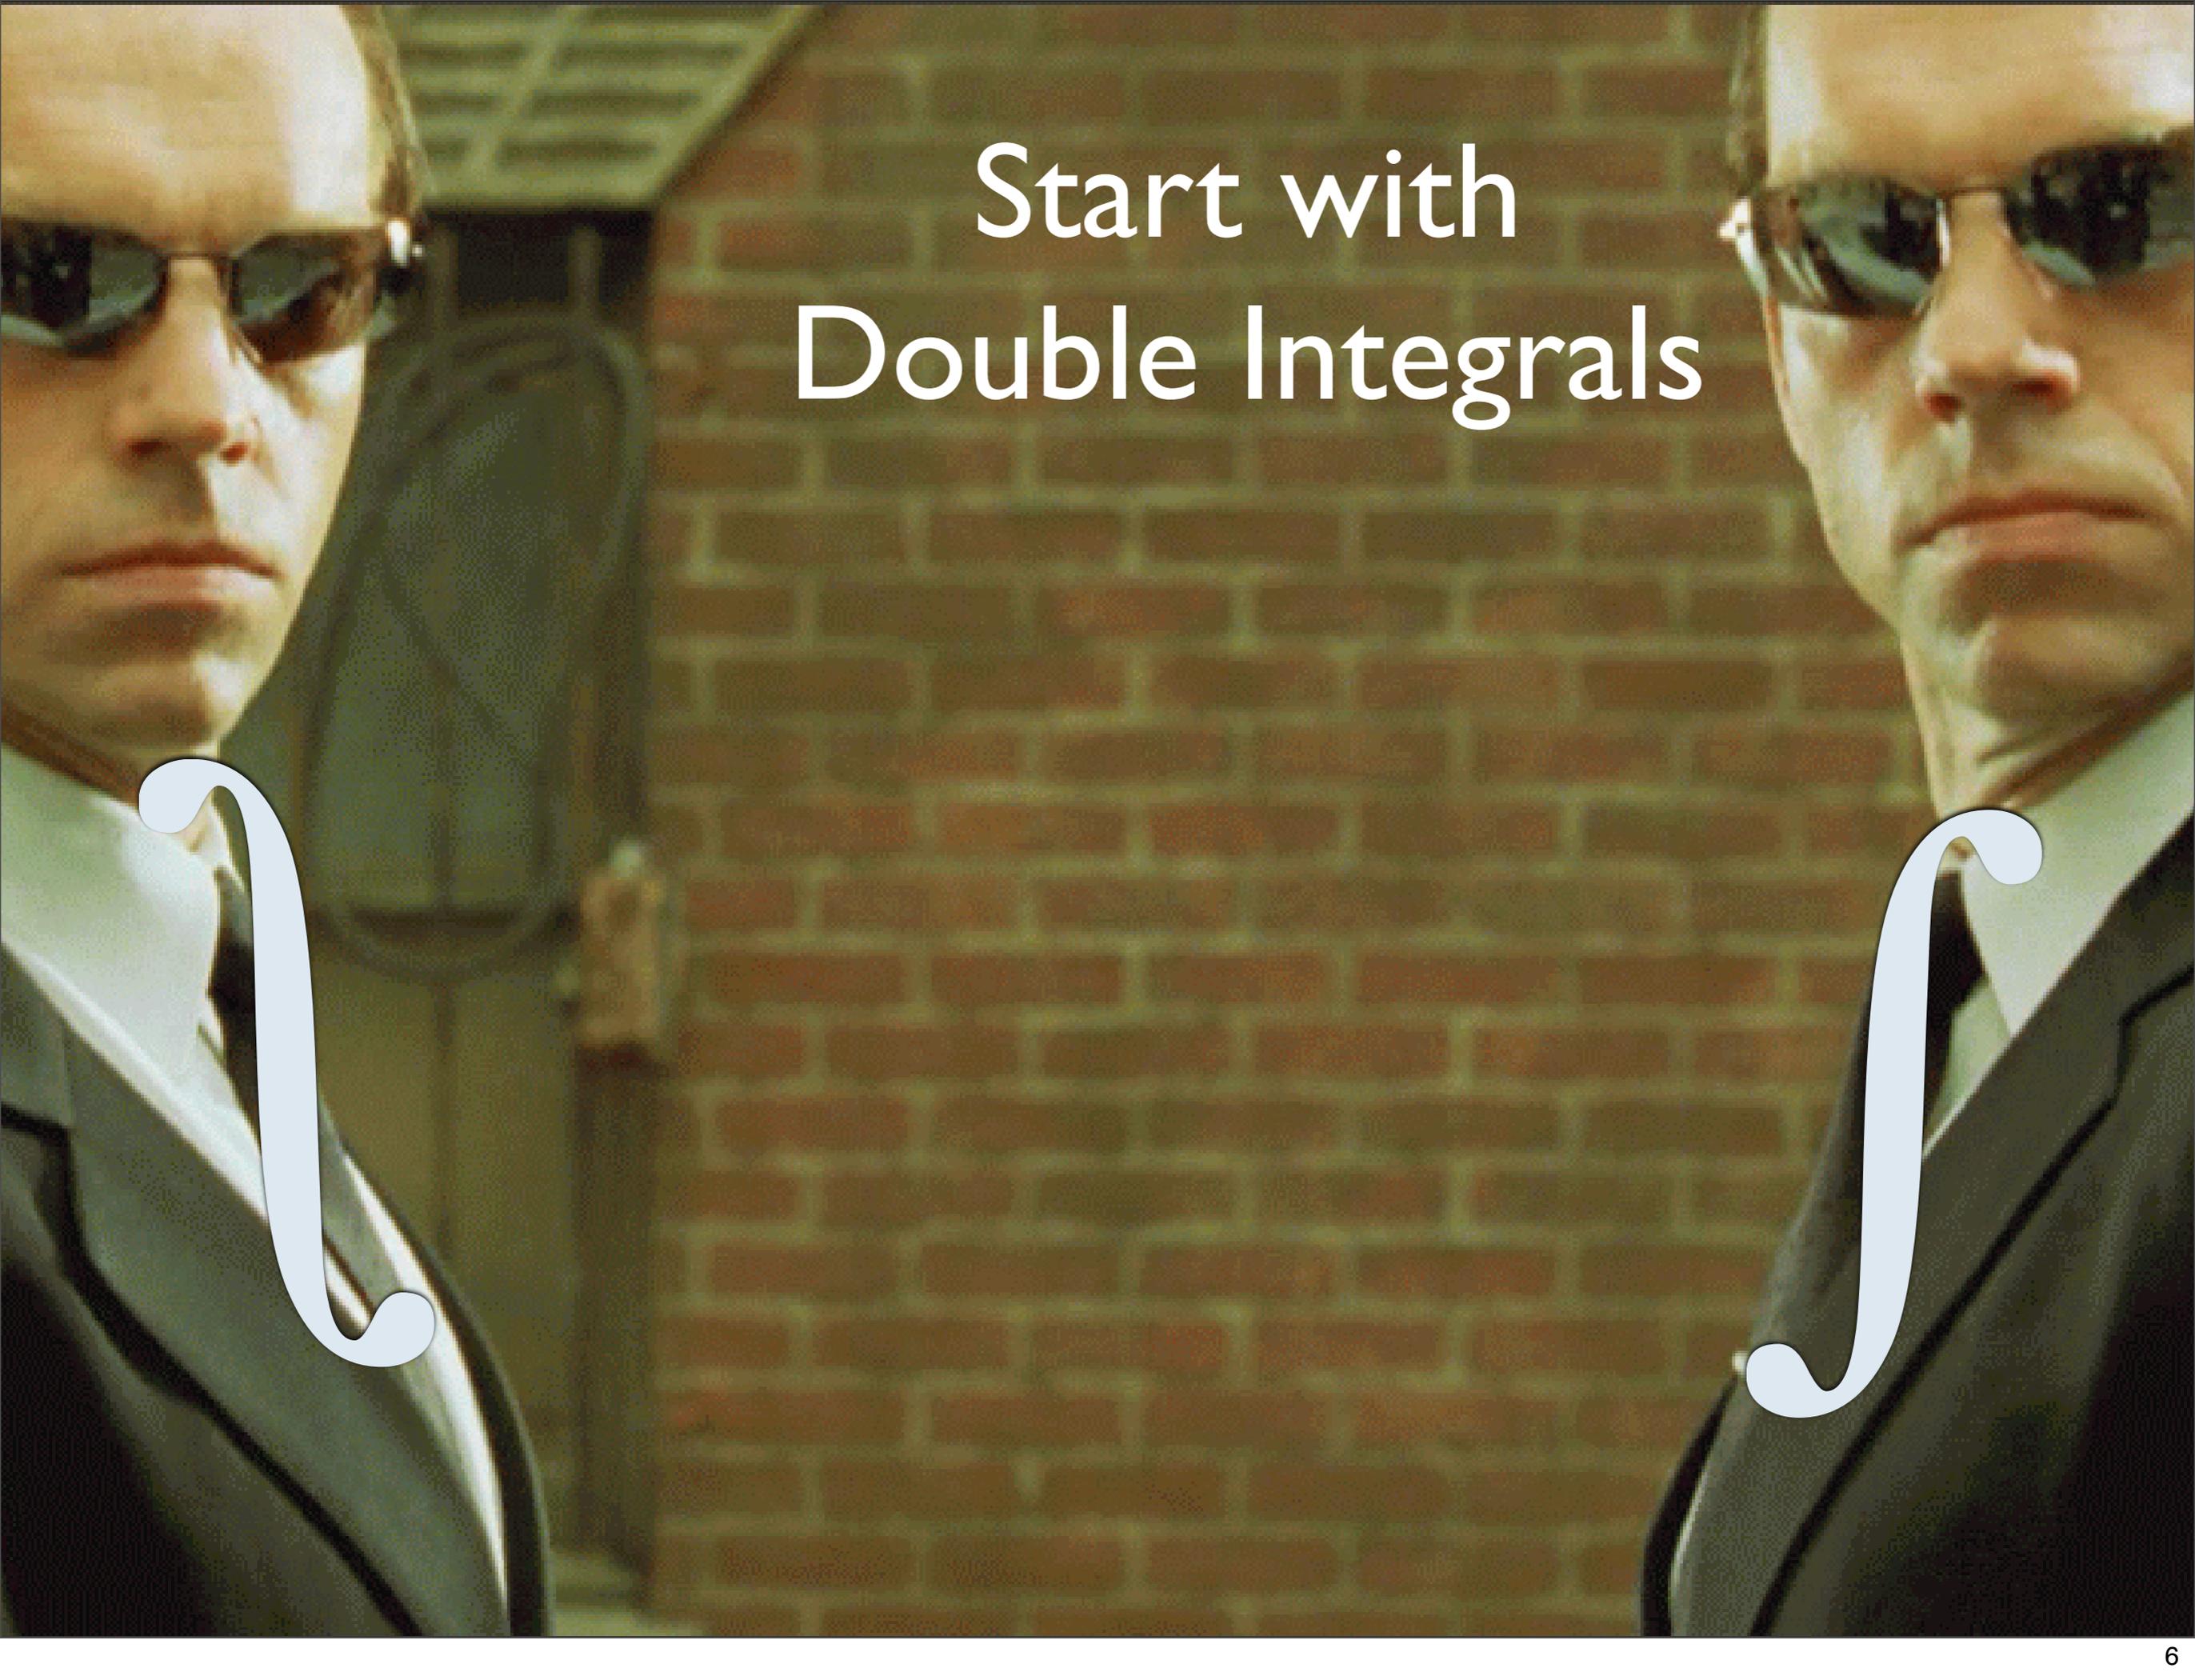

From Leonardo to Harvard

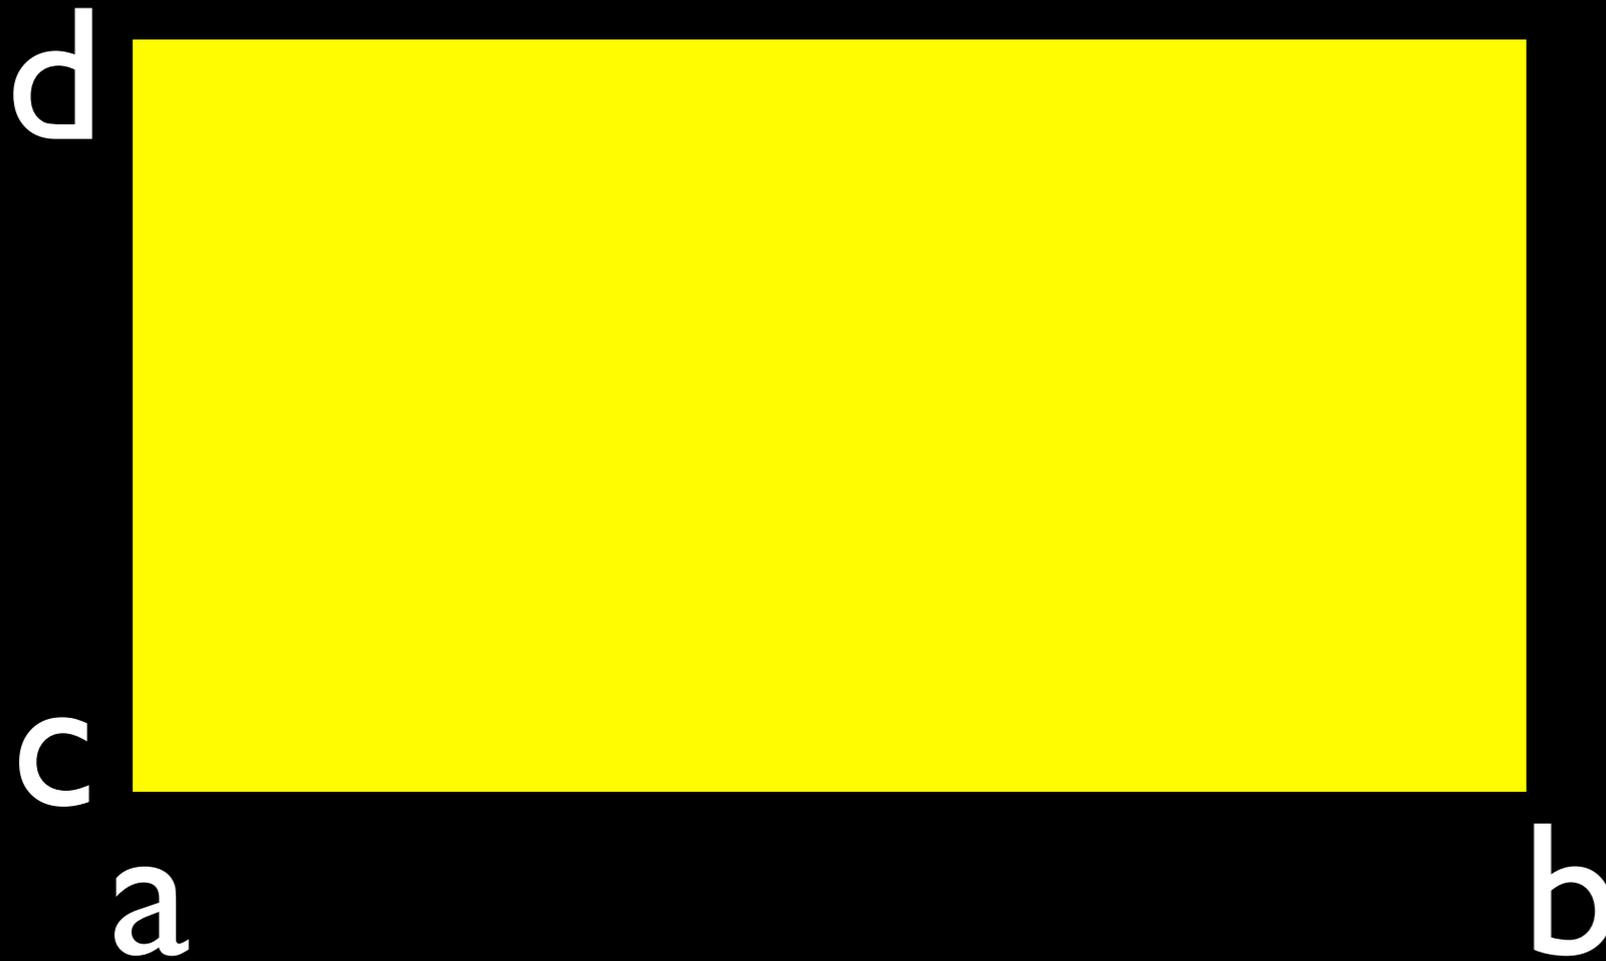

We first cover
integration

A photograph of two men in dark suits and sunglasses, standing in front of a brick wall. The man on the left is looking slightly to the right, and the man on the right is looking slightly to the left. The background is a brick wall with a doorway visible on the left.

Start with Double Integrals

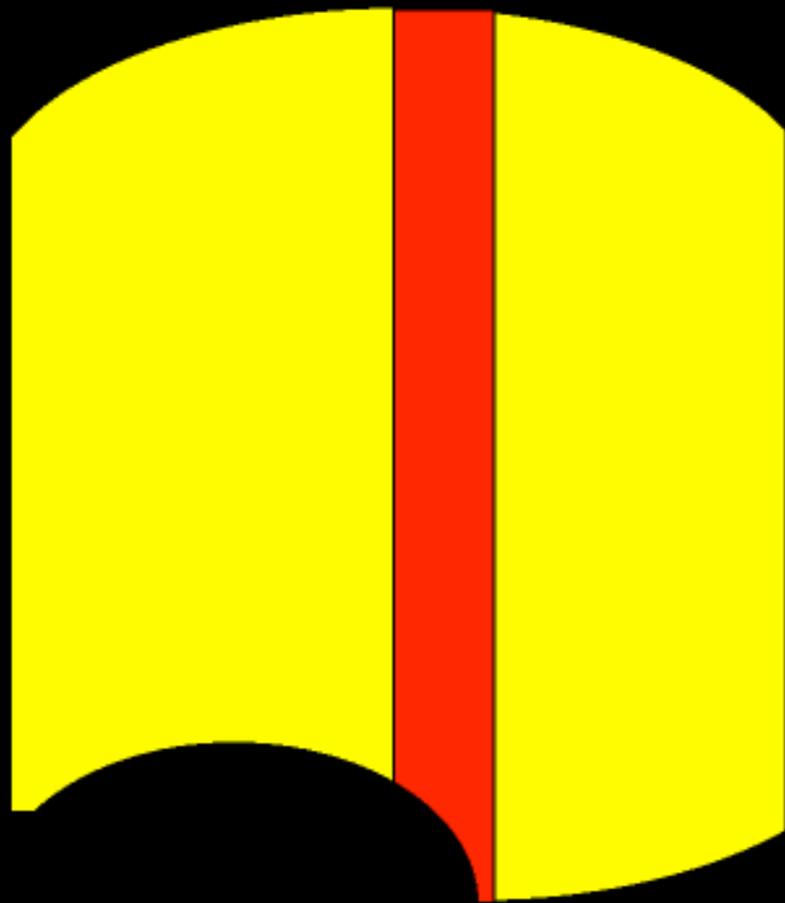

Fubini

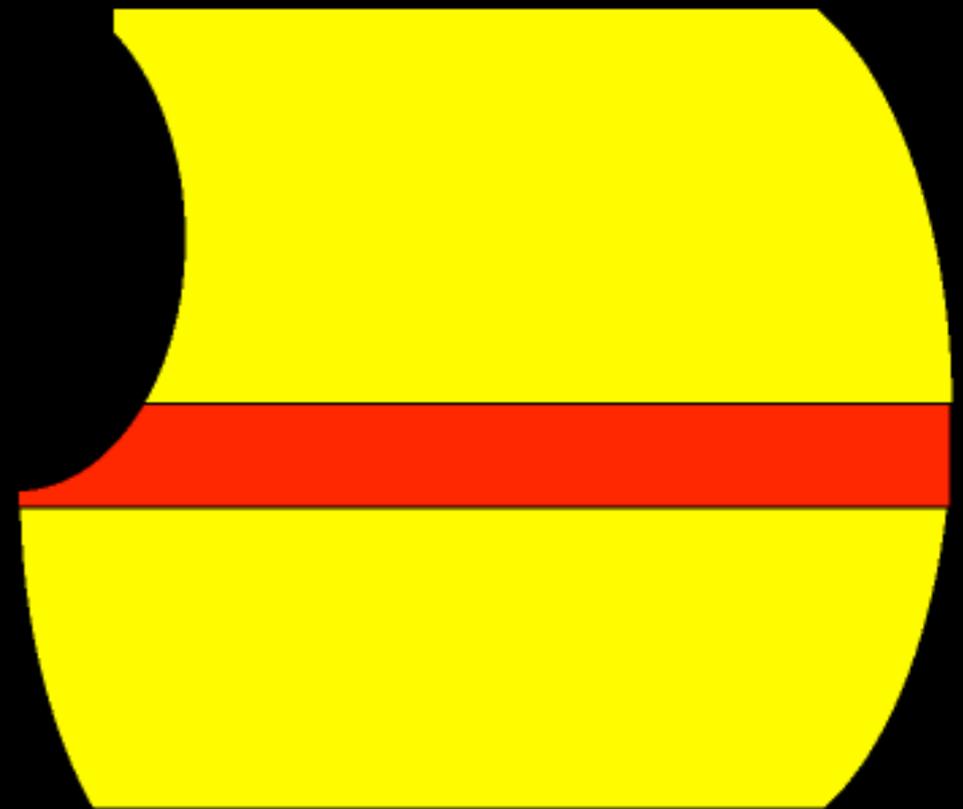

$$\int_a^b \int_c^d f(x, y) \, dy \, dx = \int_c^d \int_a^b f(x, y) \, dx \, dy$$

Double Integrals

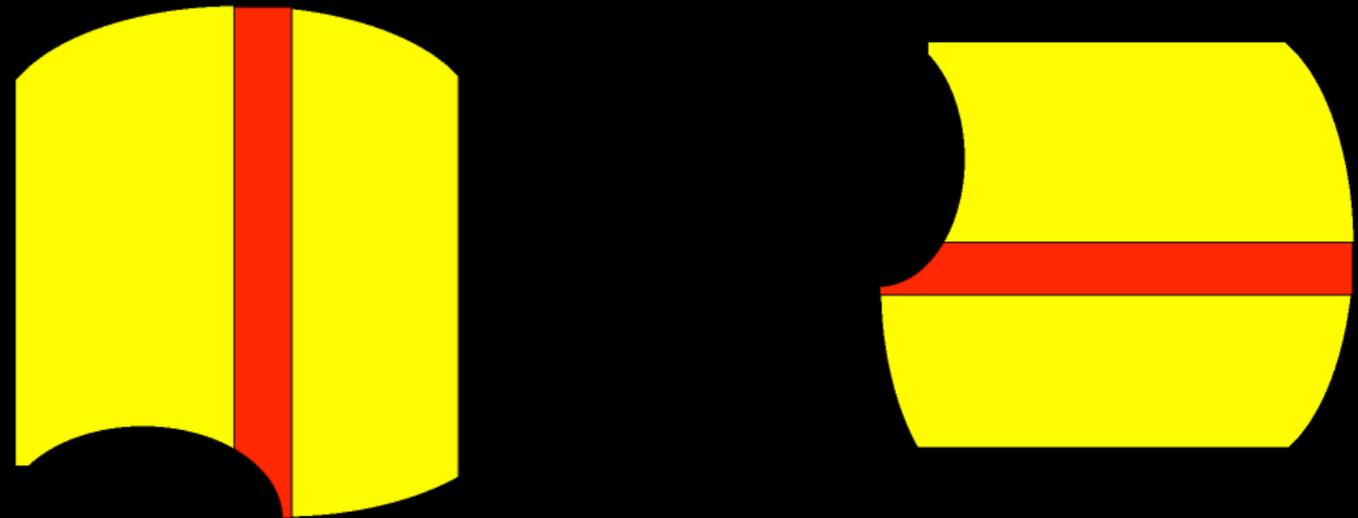

Type I

Type II

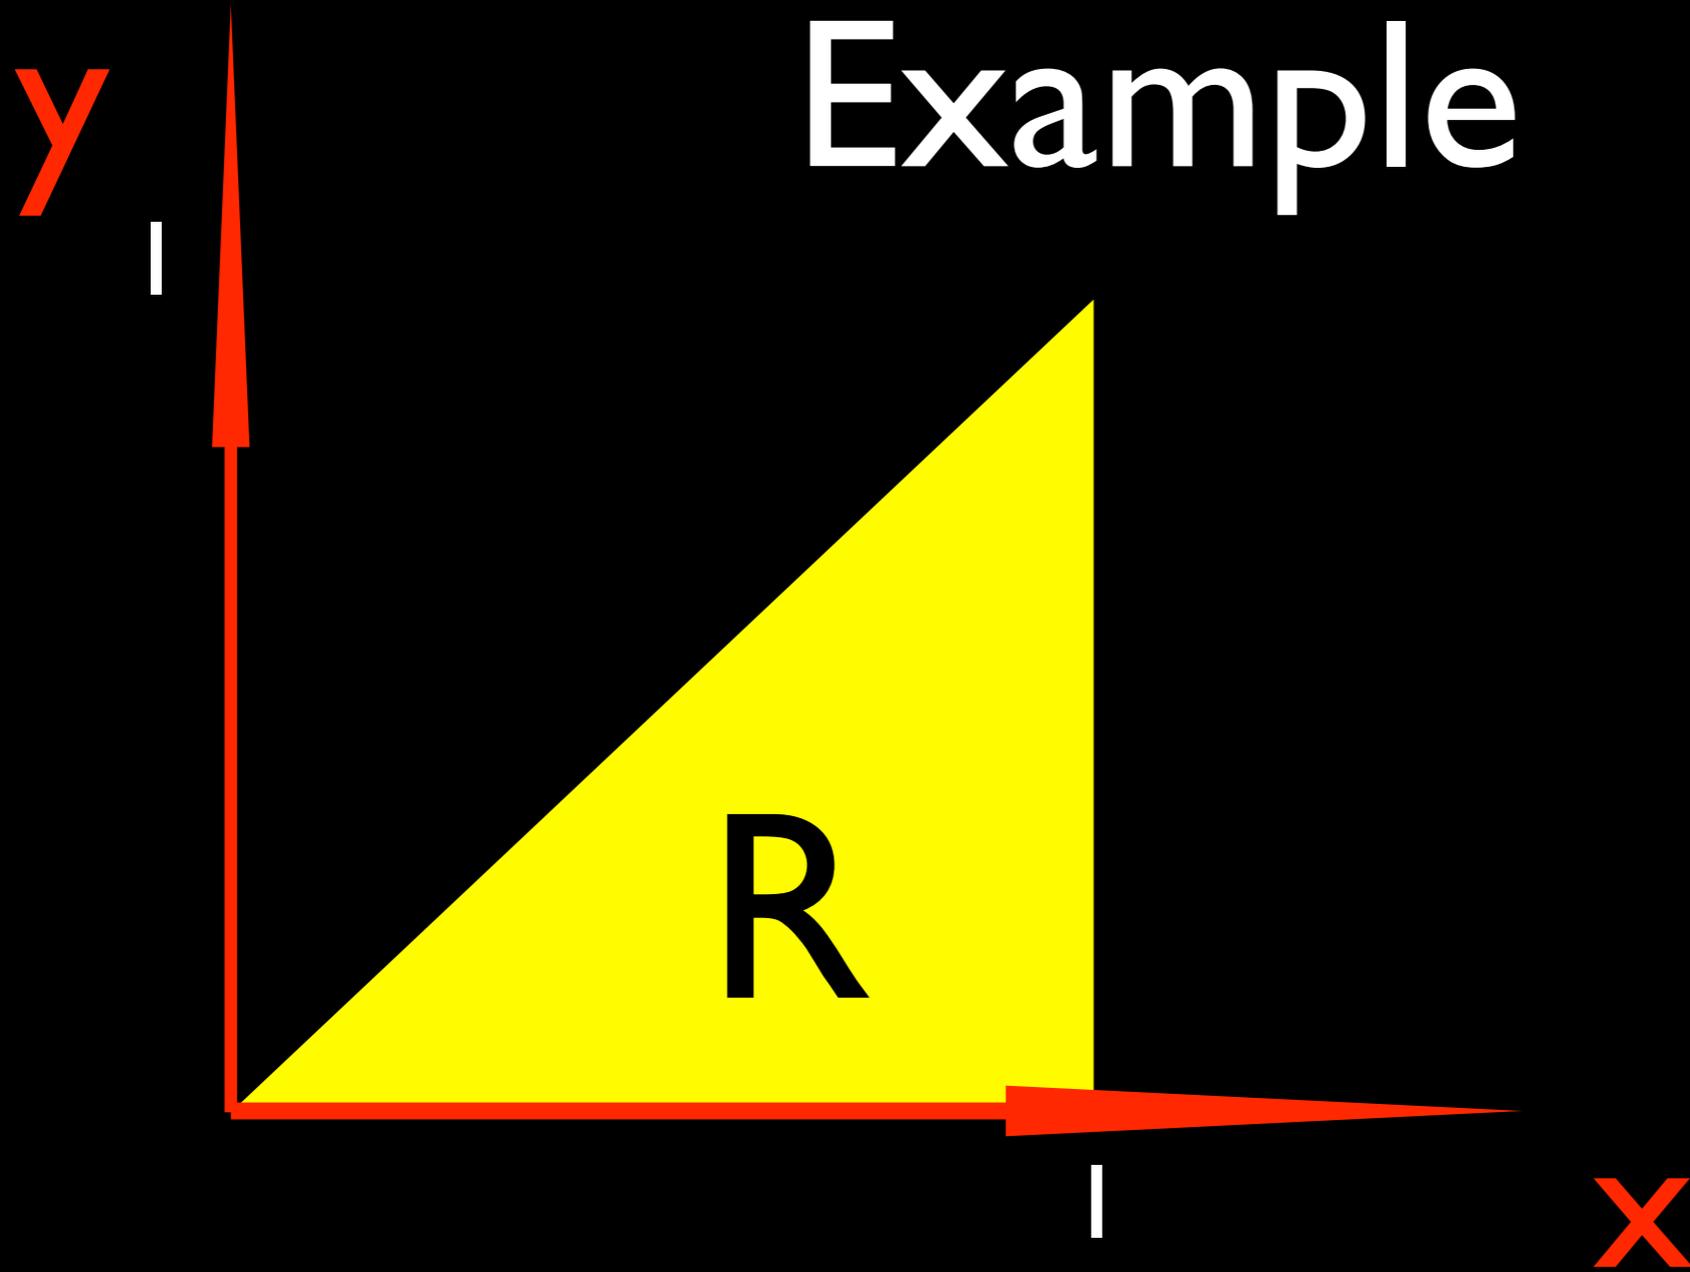

Change Type I to Type II

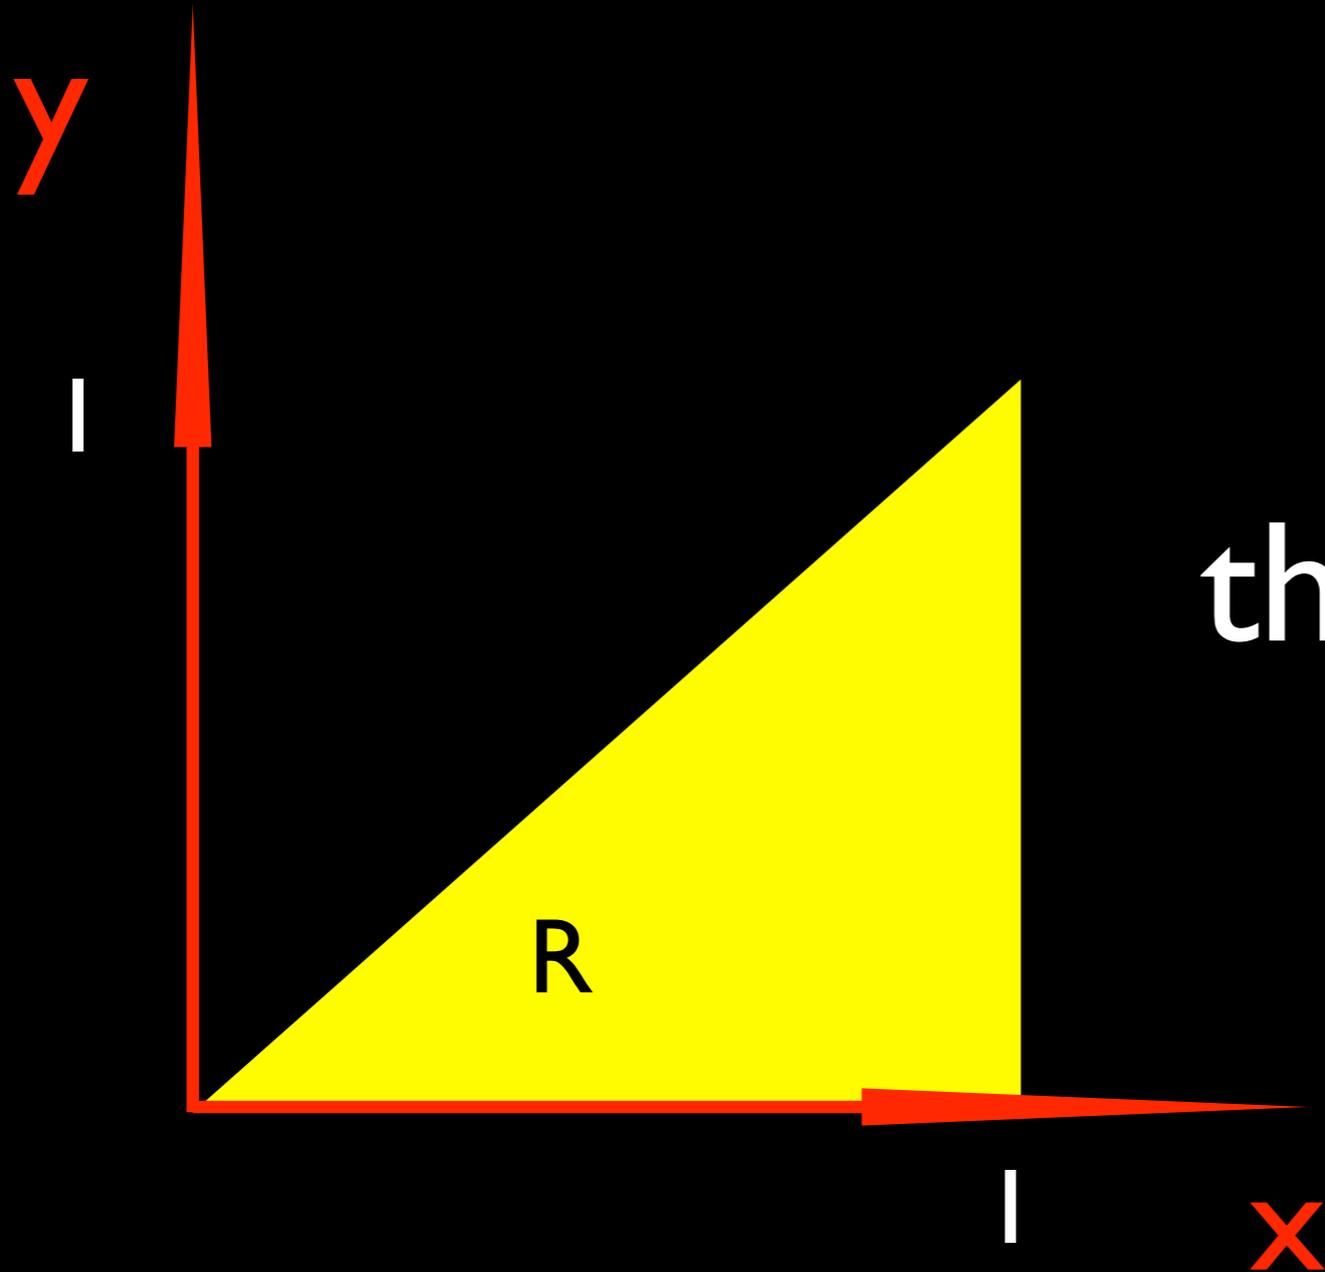

If you can not solve an integral as a type I integral, try to treat it as as type II integral

Example

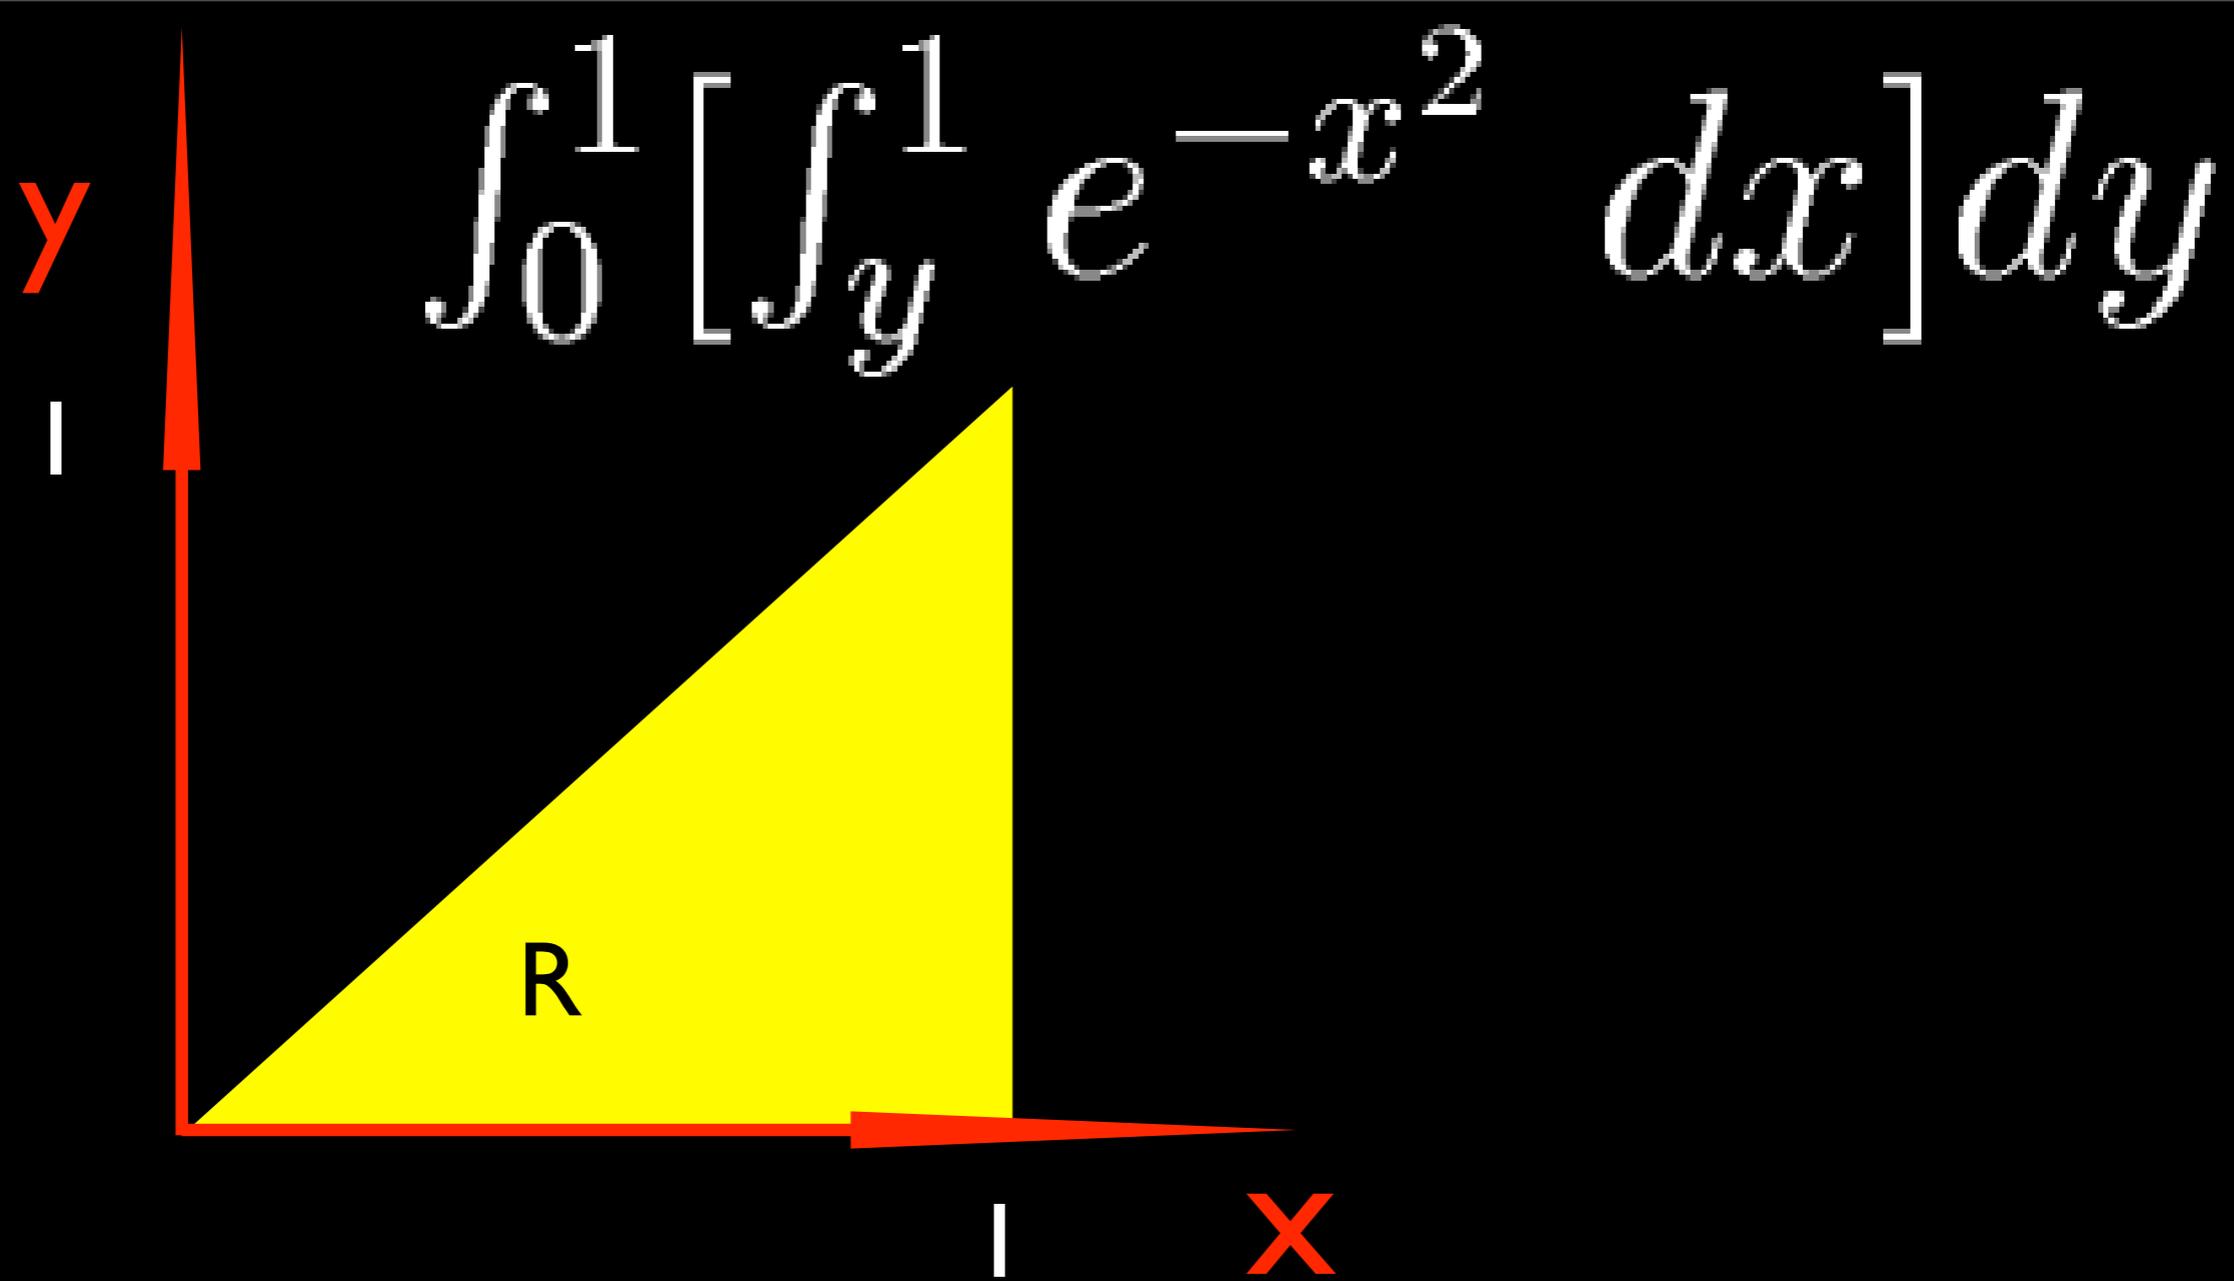

Find: $\int_0^1 \left[\int_y^1 e^{-x^2} dx \right] dy$

this is a Type II
integral

$$\int_0^1 \left[\int_y^1 e^{-x^2} dx \right] dy$$

Are stuck!

Change order
of integration:

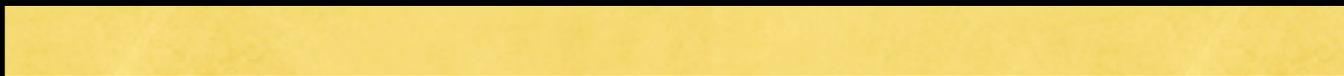

$$\int_0^1 [\int_0^x e^{-x^2} dy] dx$$

$$\int_0^1 x e^{-x^2} dx = -\frac{e^{-x^2}}{2} \Big|_0^1 = \frac{(1 - e^{-1})}{2}$$

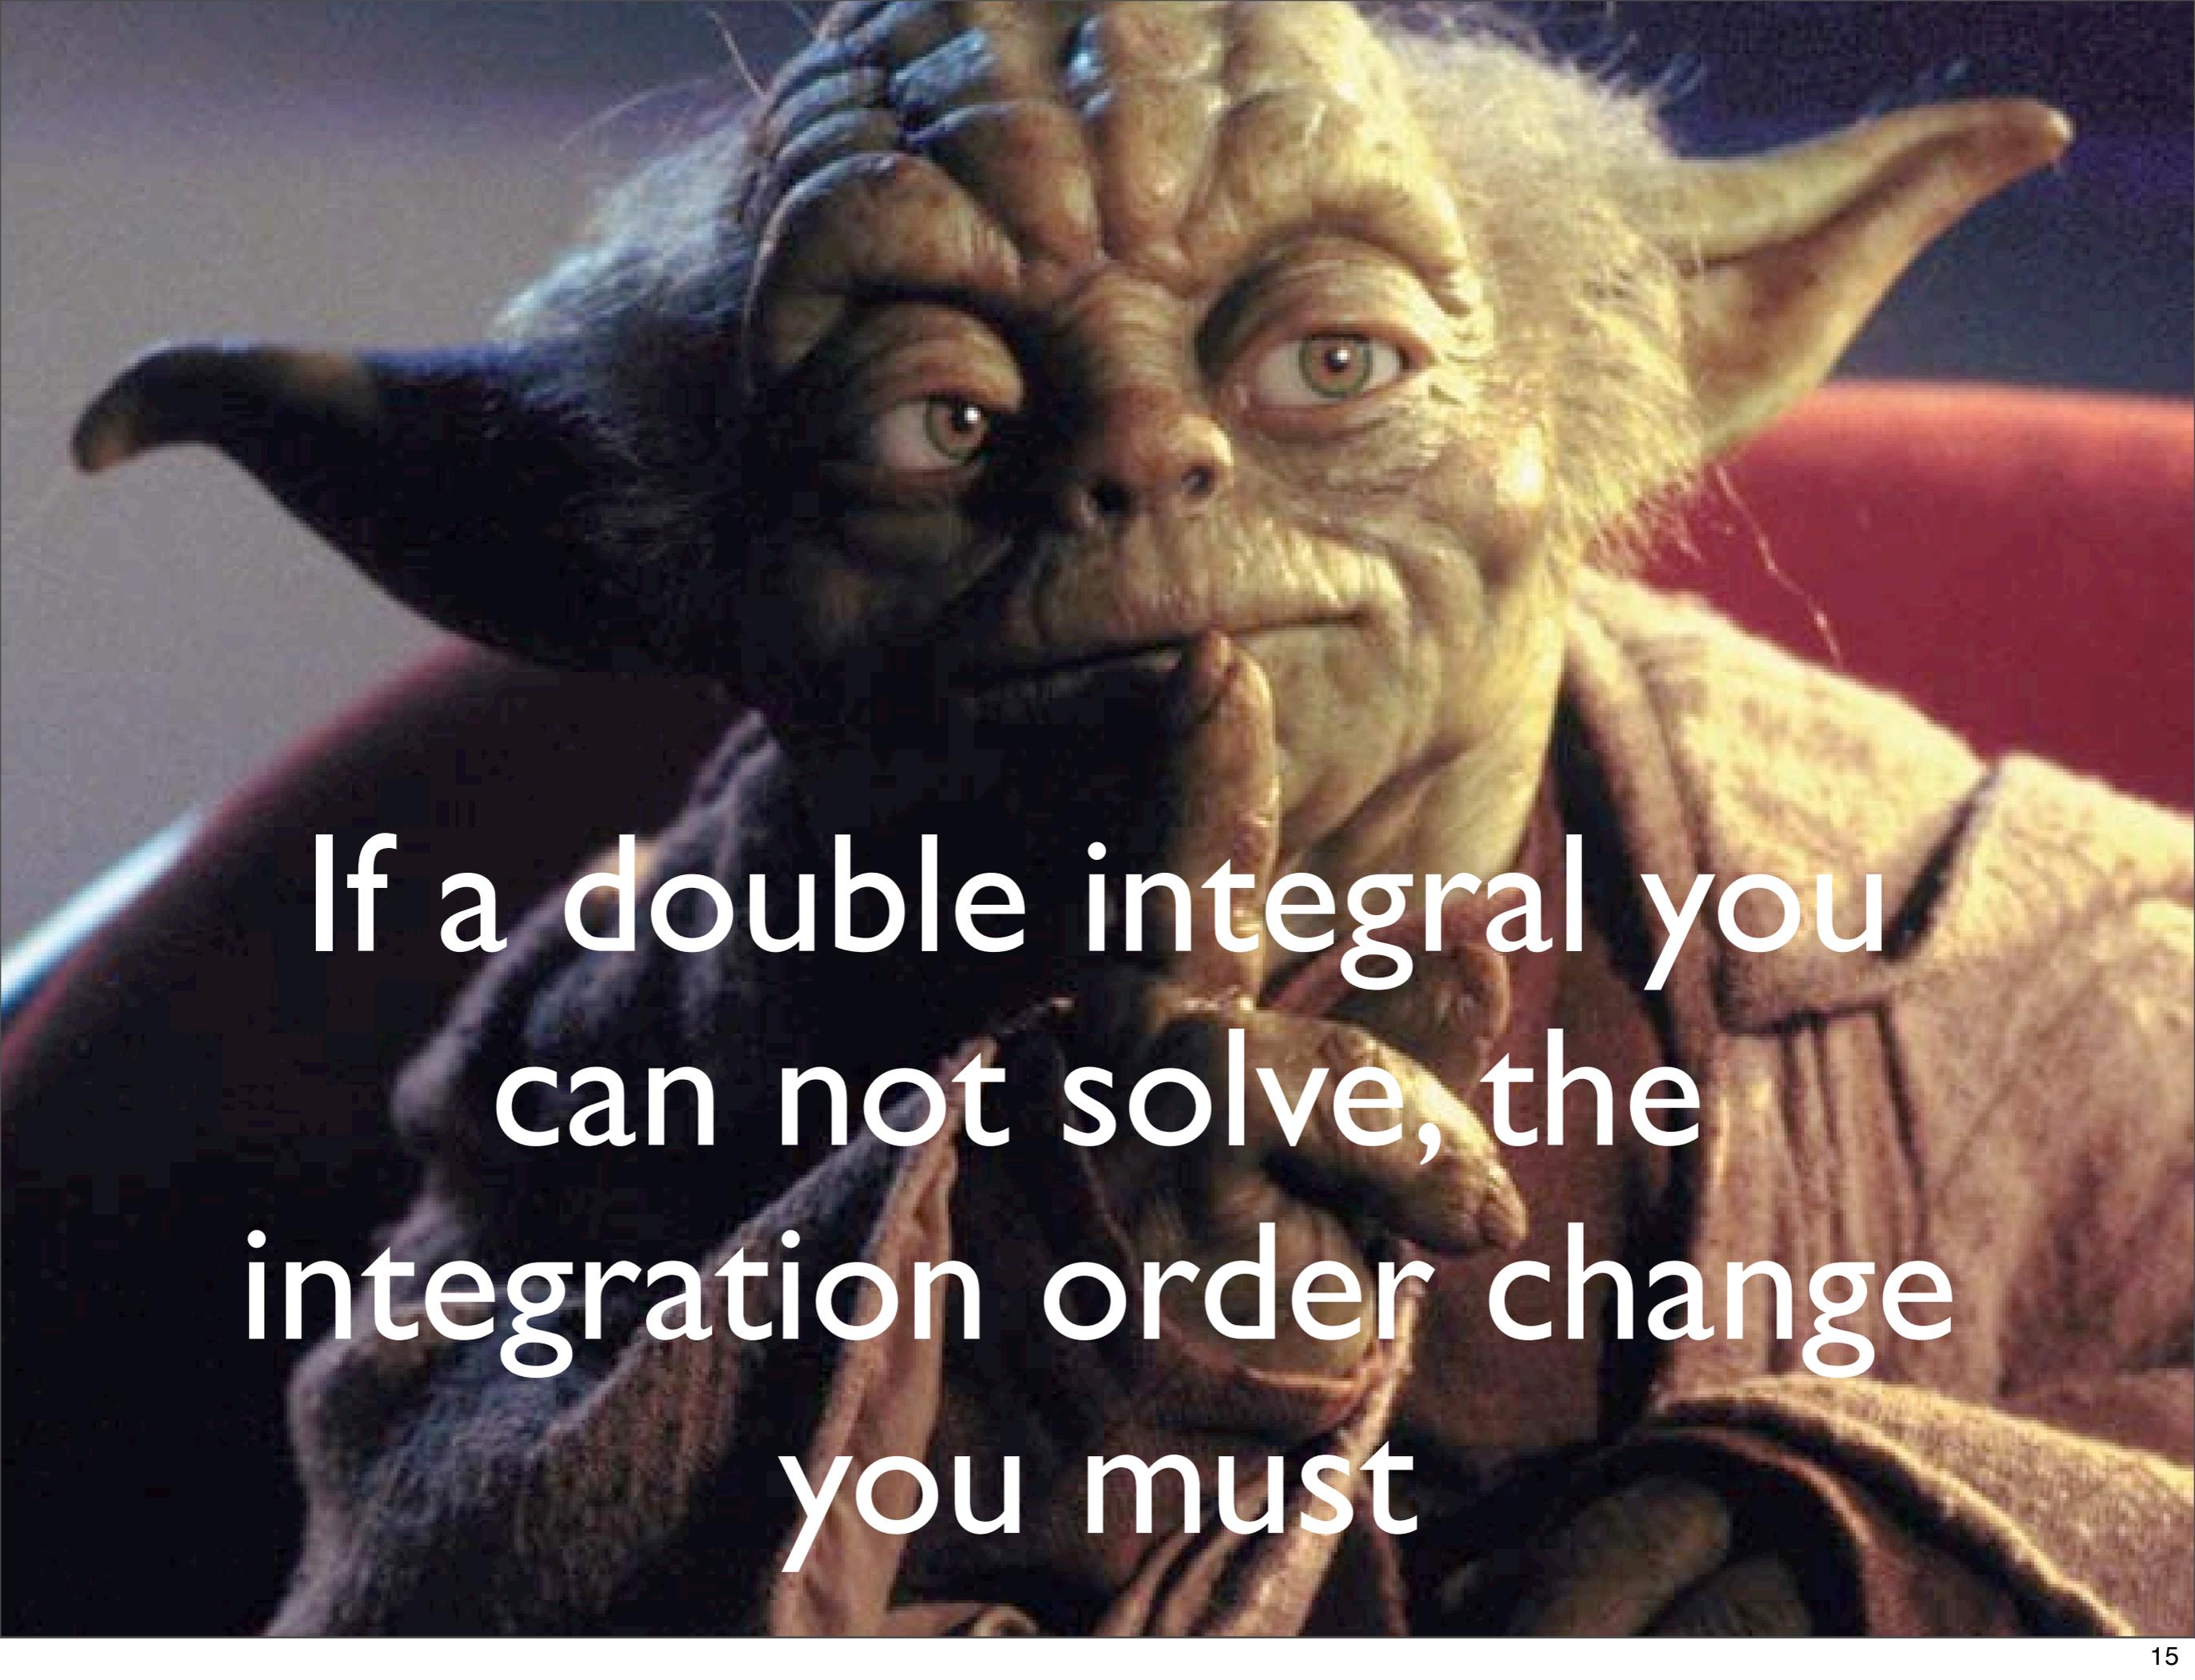

Example: What is

$$\int_0^8 \int_{x^{1/3}}^2 \frac{1}{y^4 + 1} dy dx$$

Look at the inner integral:

$$\int_0^8 \int_{x^{1/3}}^2 \frac{1}{y^4 + 1} dy dx$$

It does not look good.

If a double integral you
can not solve, the
integration order change
you must

y

x

A close-up of Yoda's face from Star Wars. He has a finger pressed against his lips in a 'shh' gesture. The background is dark with a red curved shape.

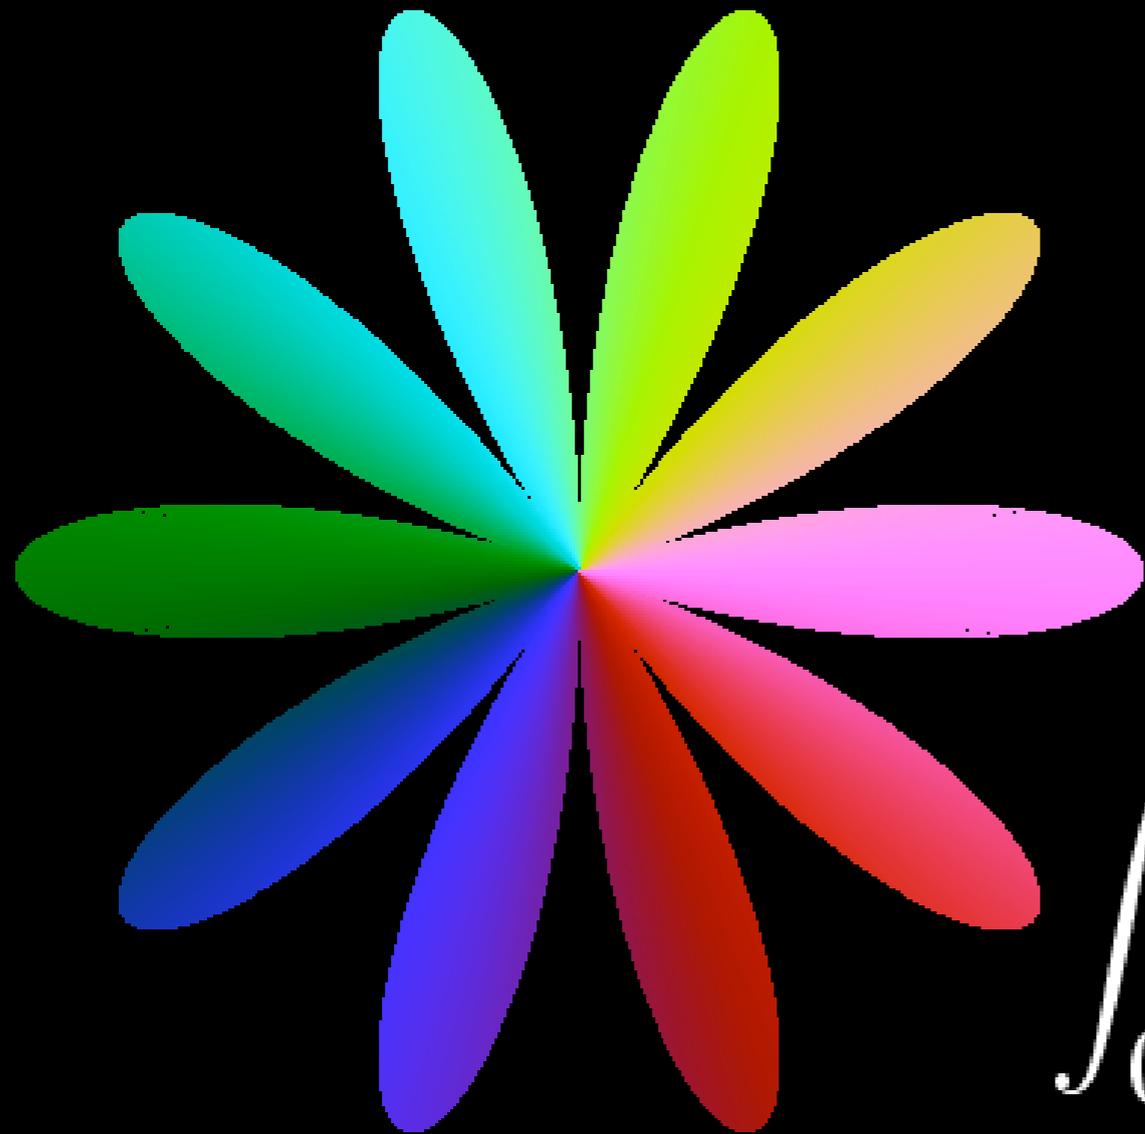

If an integral solve you
can't, other coordinate
systems consider you
must

Polar coordinates

Polar coordinates

$$\int_0^{2\pi} \int_0^{r(\theta)} r \, dr \, d\theta$$

Example

$$r(\theta) = |\cos(n\theta)|$$

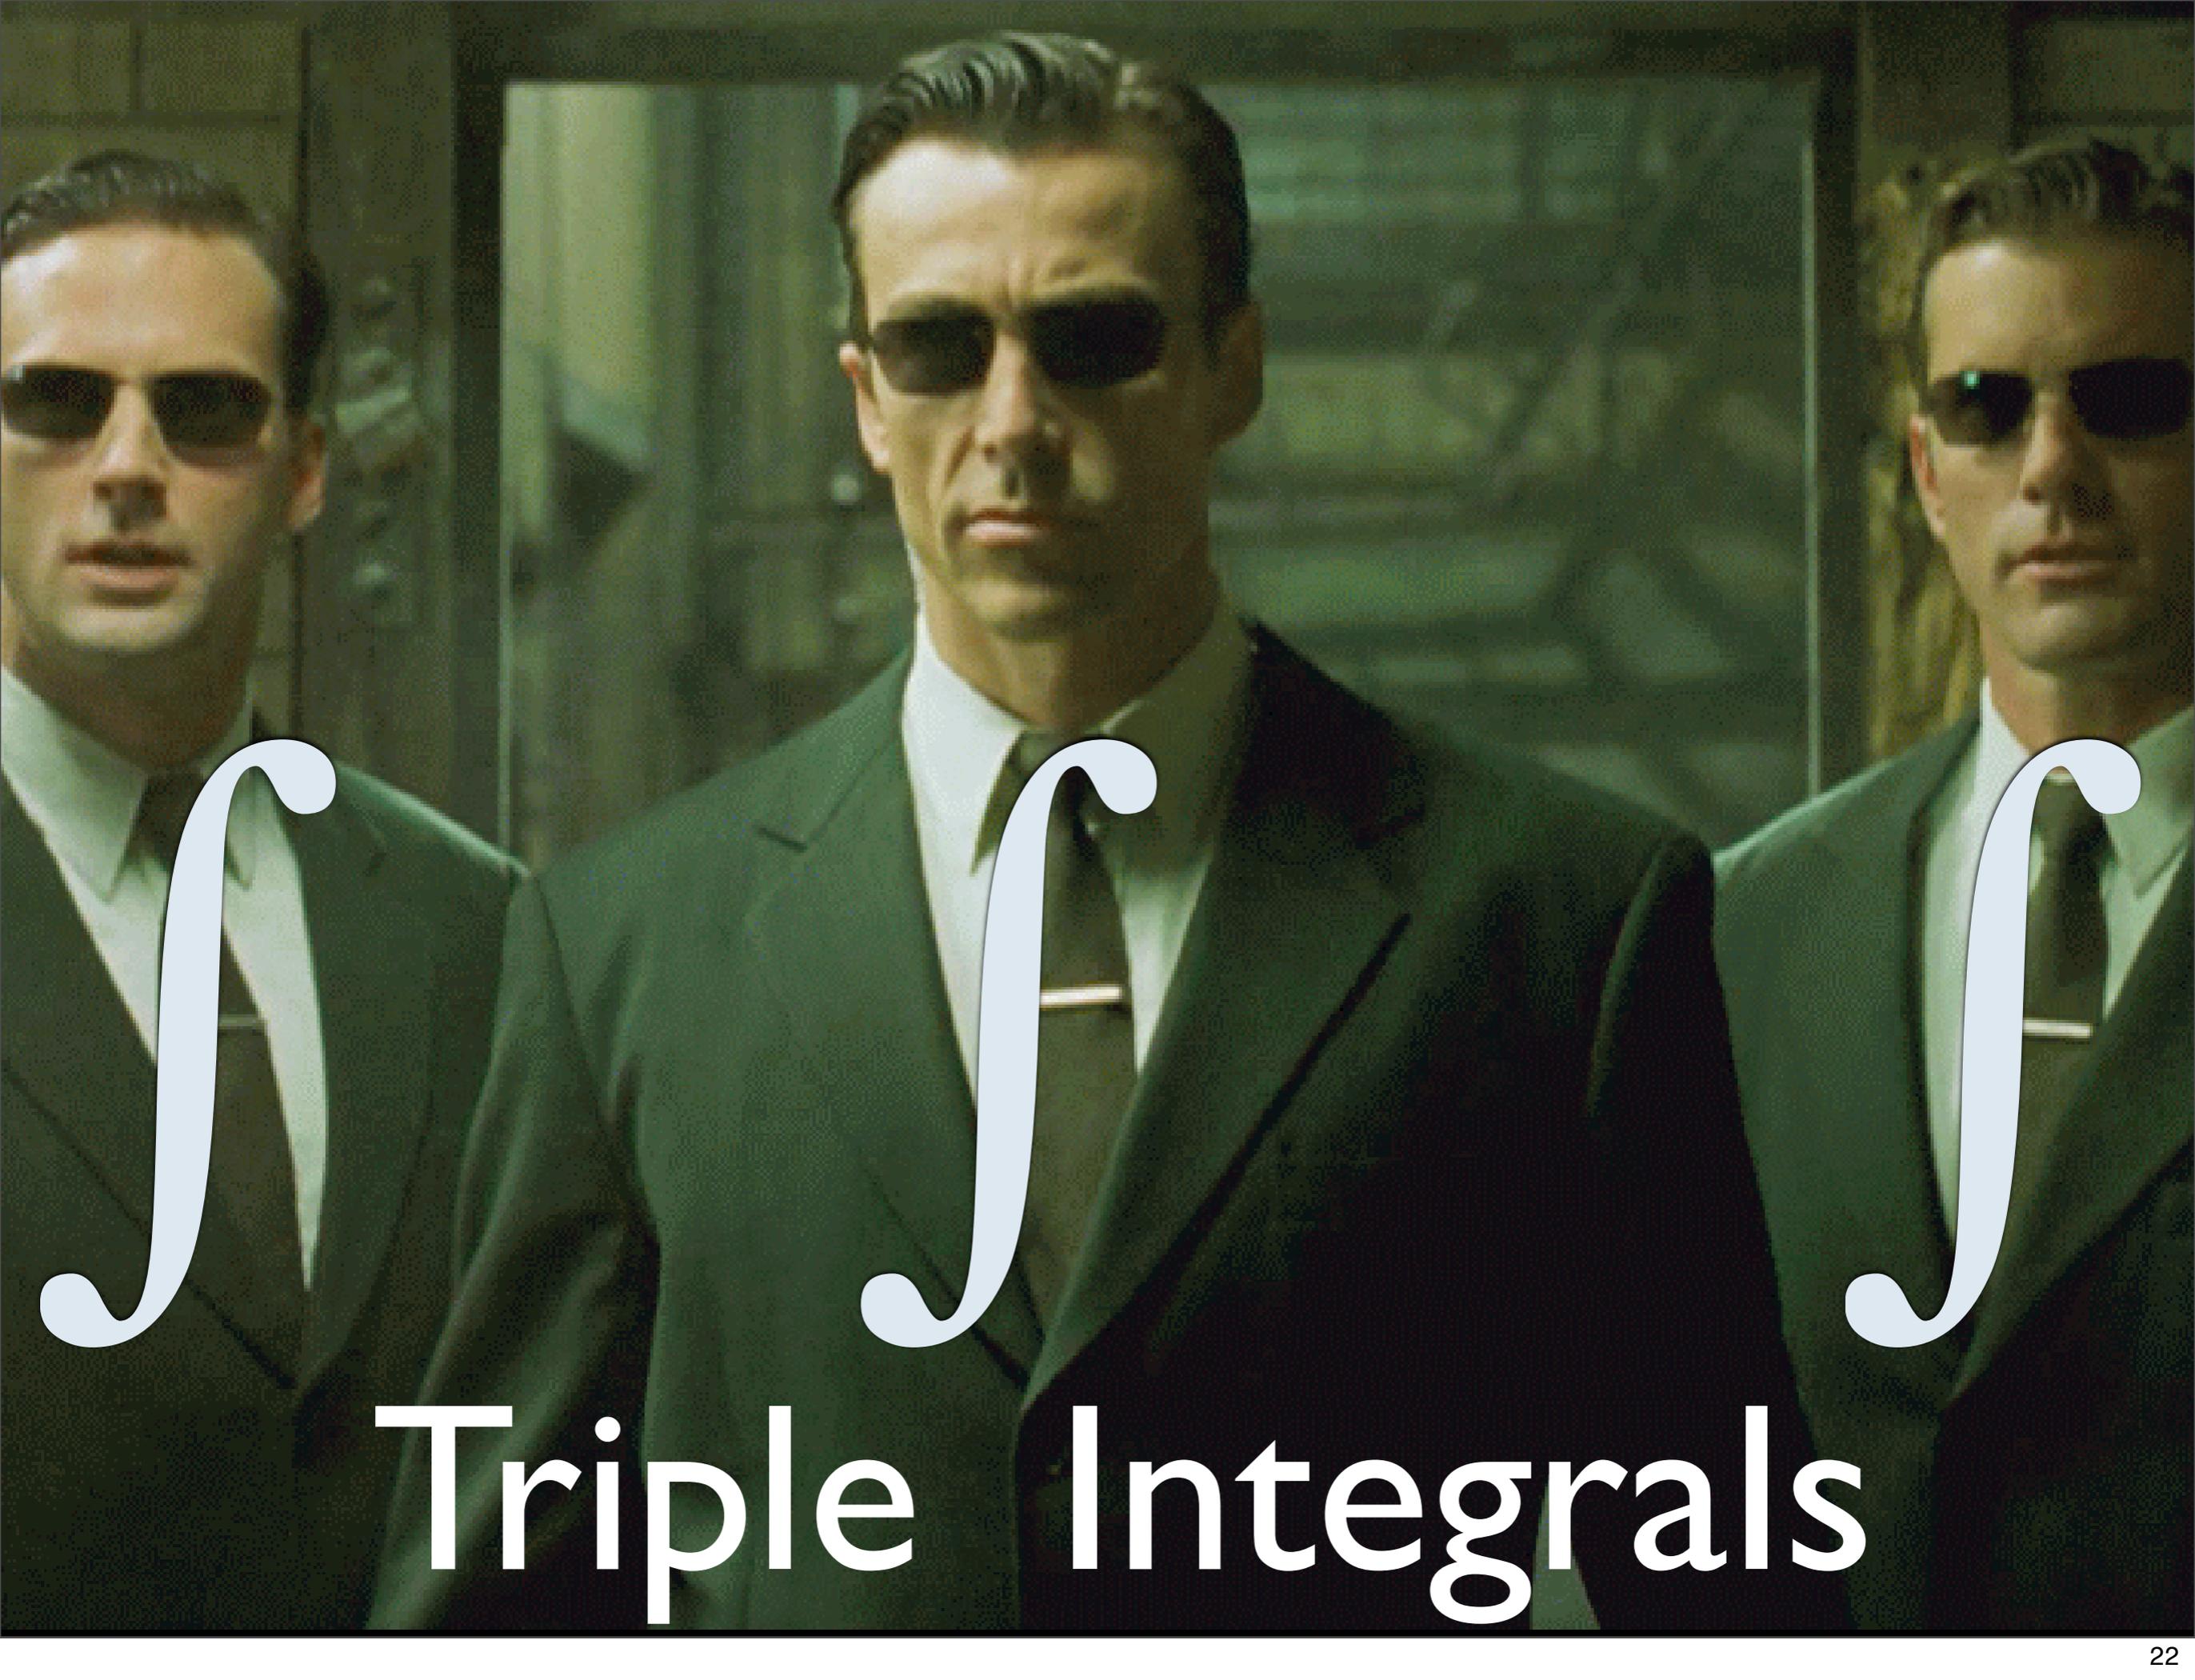

$$\int_0^{2\pi} \frac{\cos^2(n\theta)}{2} \, d\theta = \frac{\pi}{2}$$

Problem: What is

$$\int_0^4 \int_0^{\sqrt{16-y^2}} e^{\sqrt{x^2+y^2}} dx dy$$

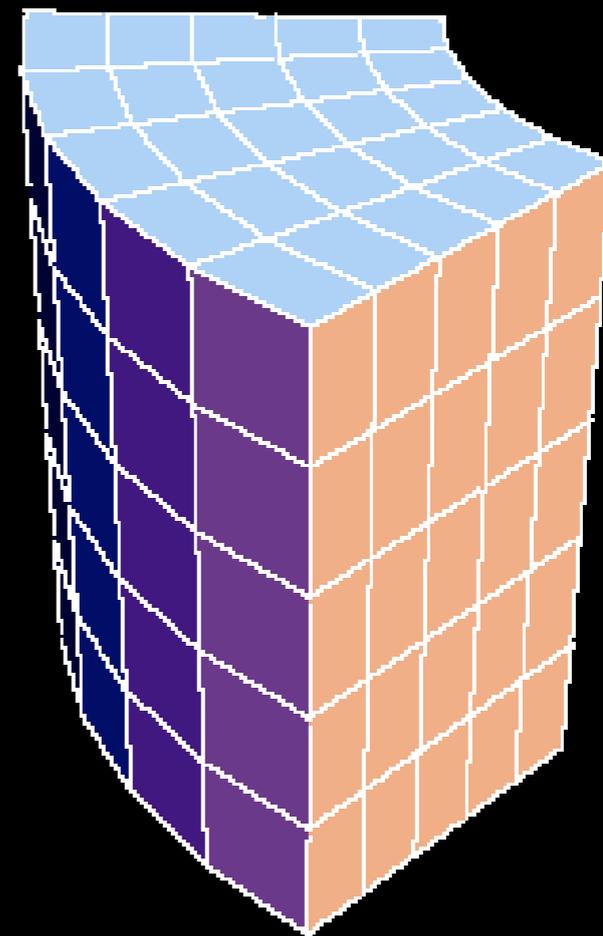

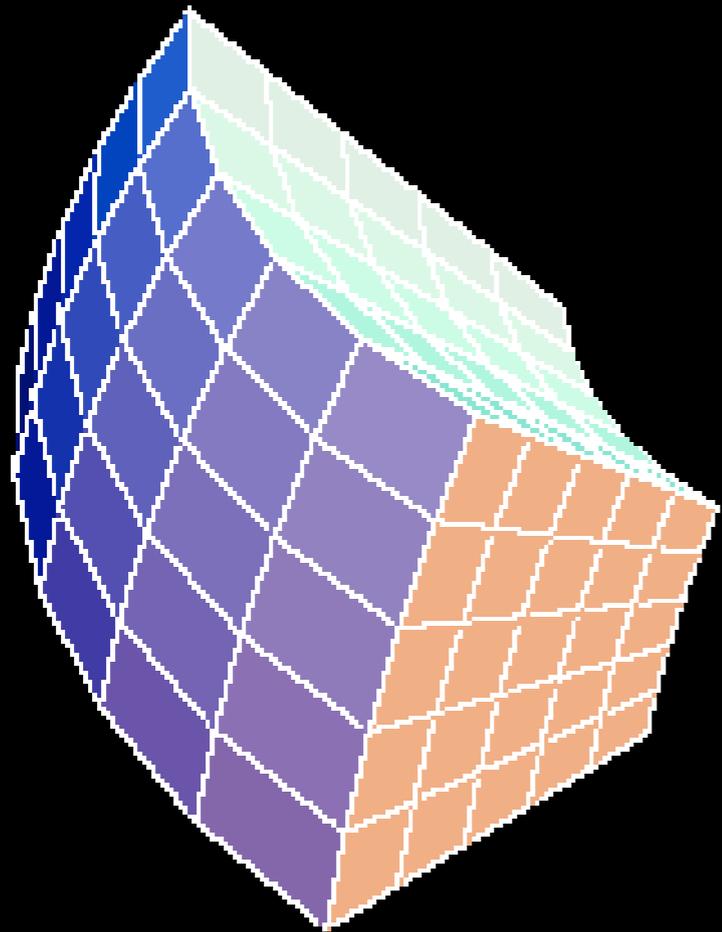

This smells like
Polar coordinates!

$$\int_0^4 \int_0^{\sqrt{16-y^2}} e^{\sqrt{x^2+y^2}} dx dy$$

Triple Integrals

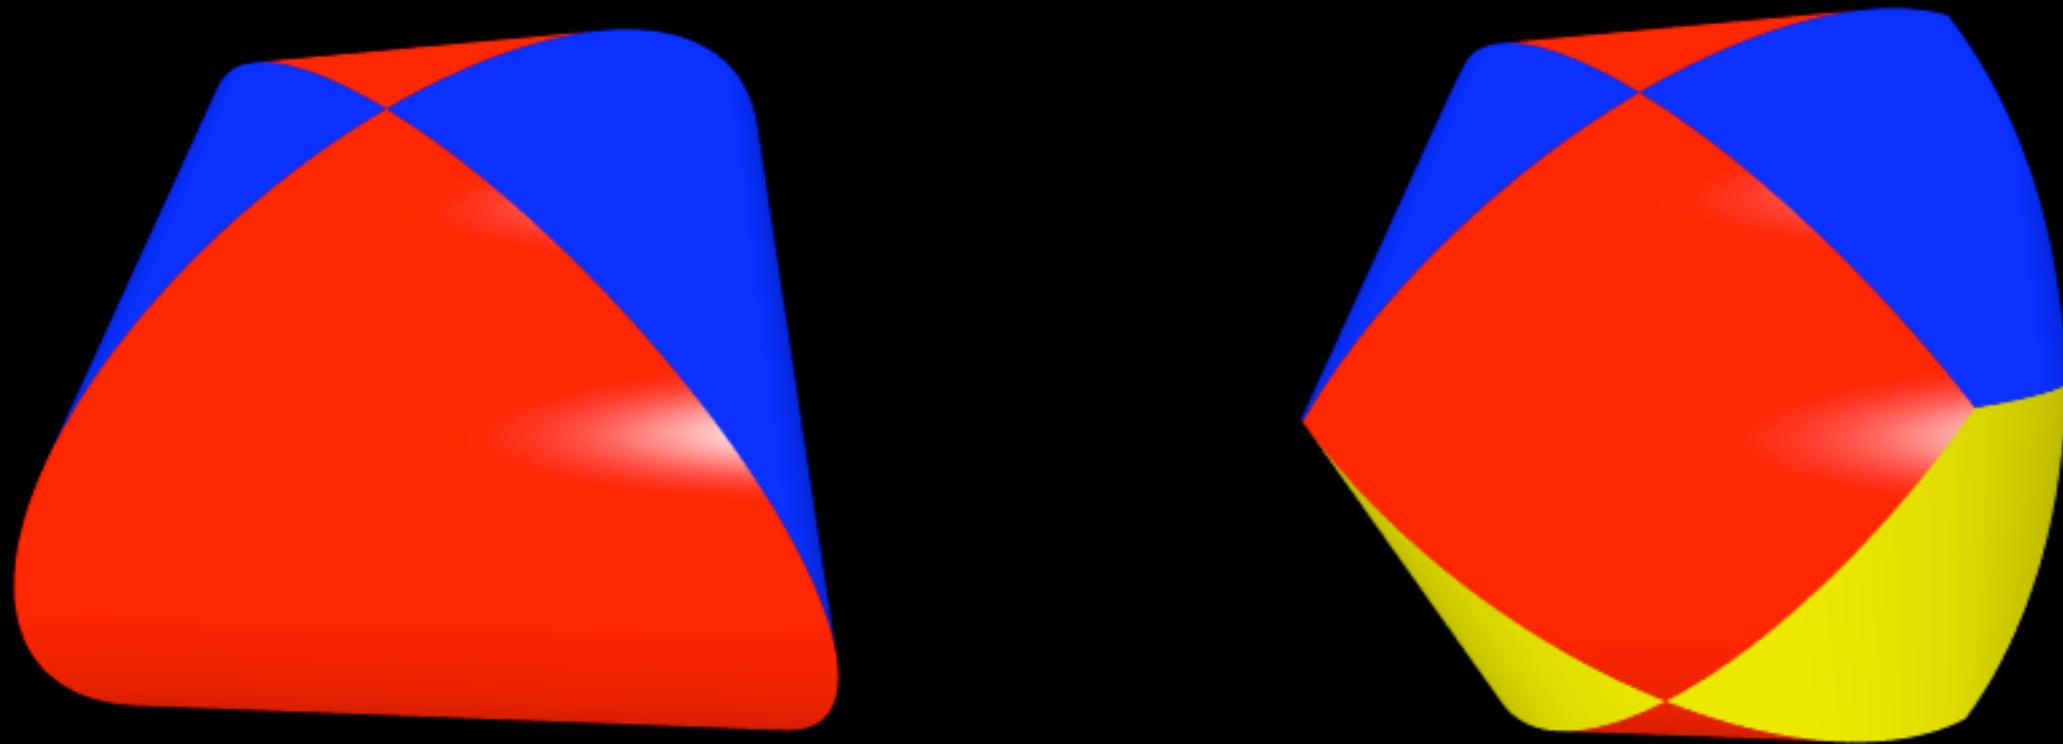

Spherical/Cylindrical Coordinates

Remember the integration factors? You
should know them by heart.

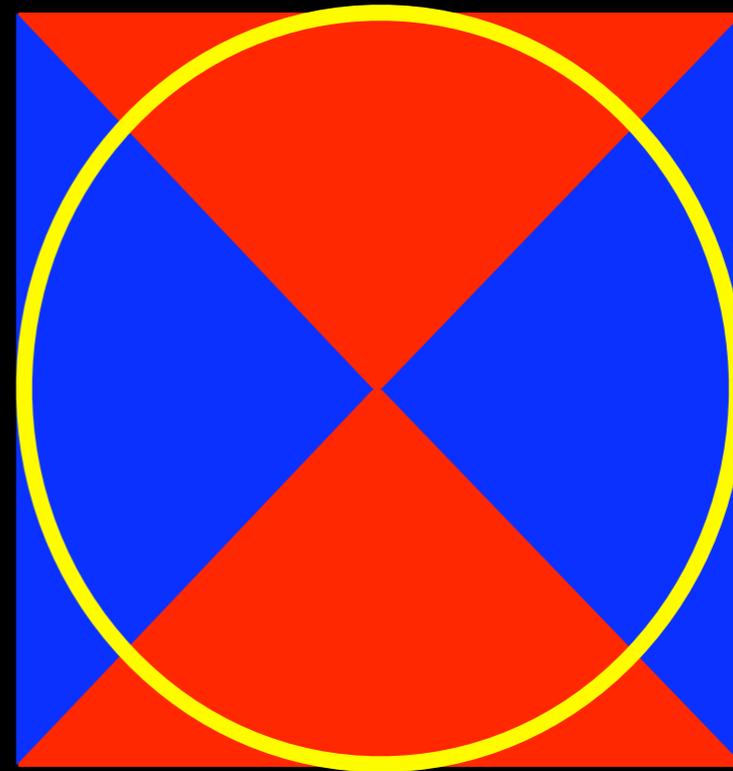

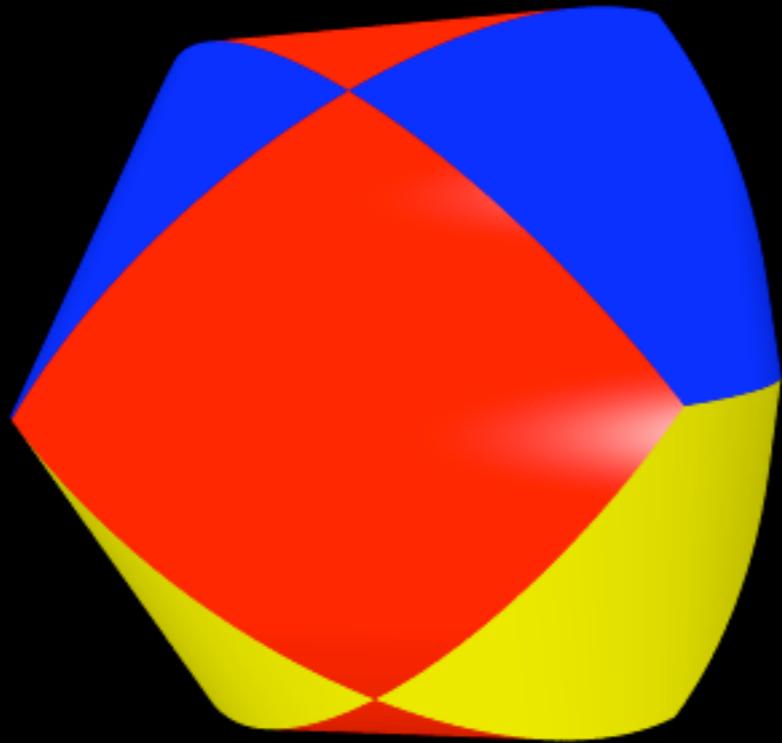

Triple Integrals

Example: Volume computation

$$\int \int \int_E 1 \, dV = \text{Vol}(E)$$

Make good pictures!

Example: Volume of the intersection of the three cylinders:

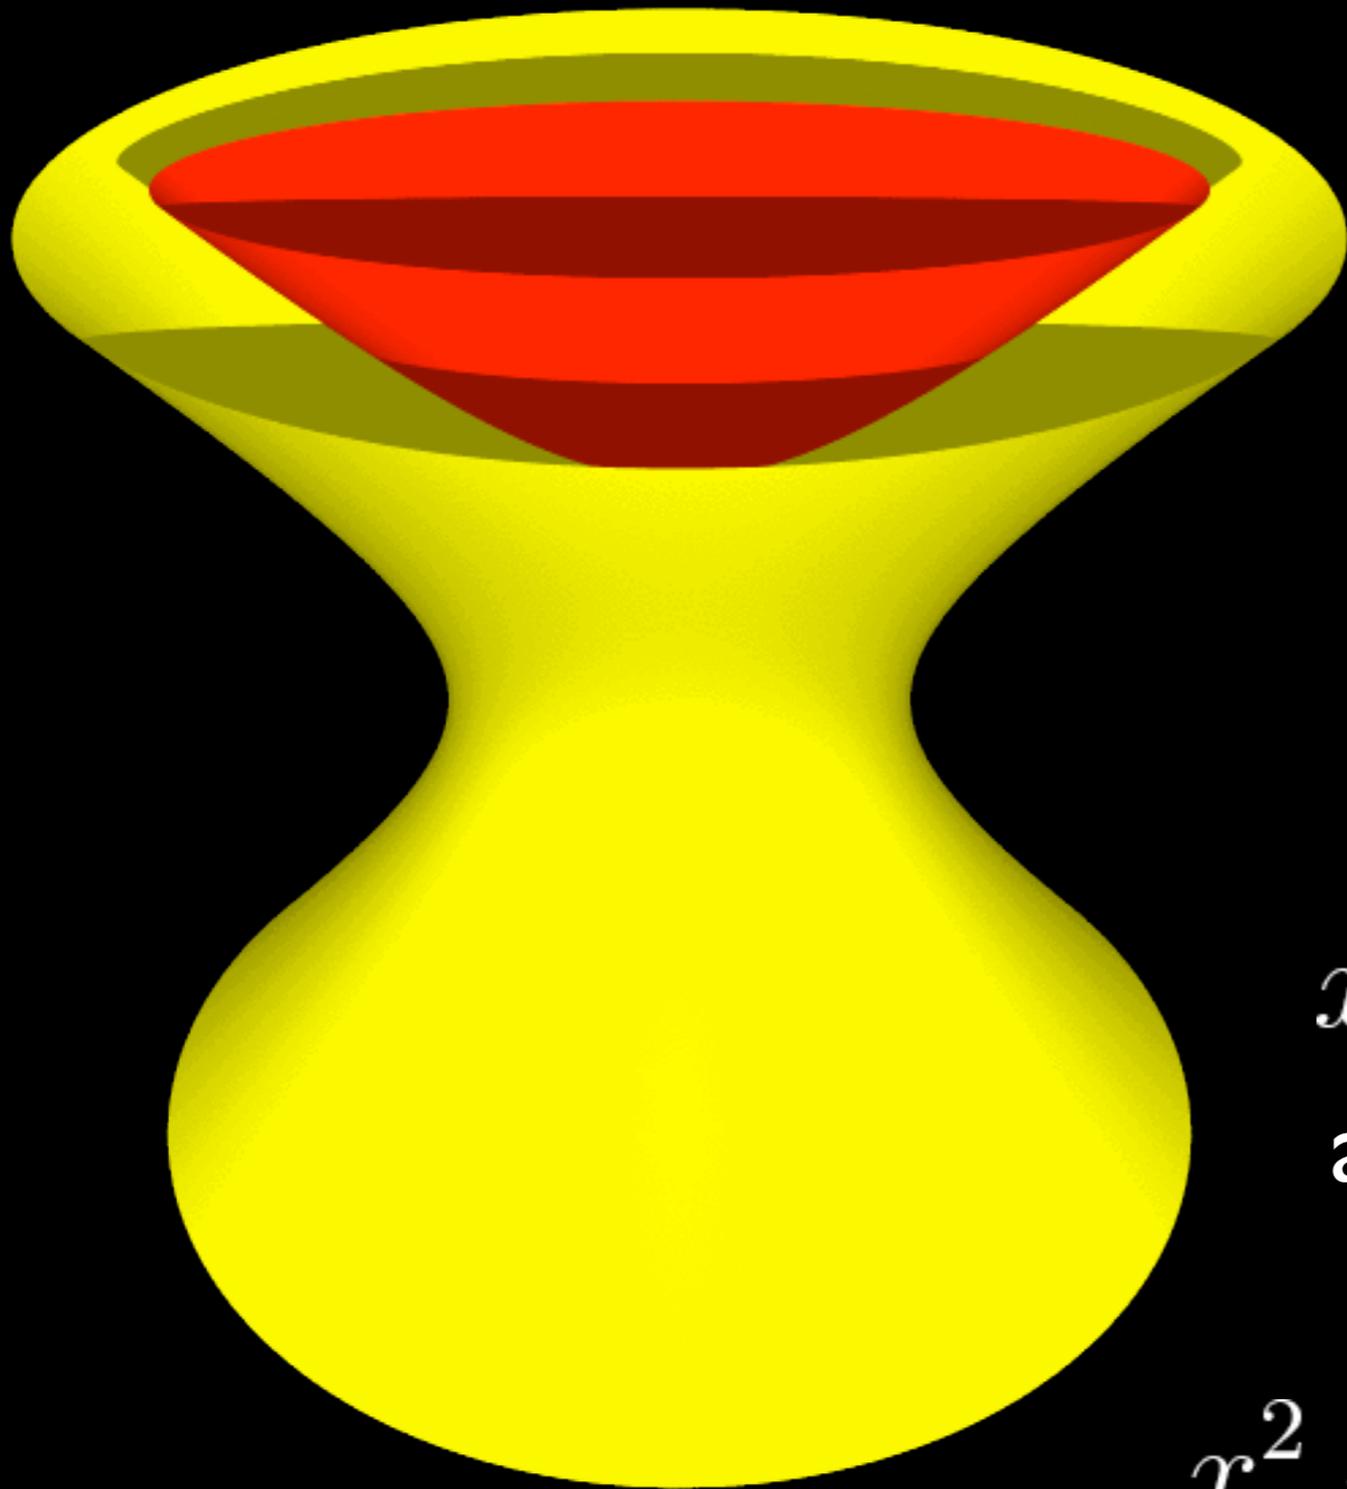

$$8 \int_{-\pi/4}^{\pi/4} \int_0^1 \sqrt{1 - r^2 \sin^2(t)} r \, dr dt = -\frac{16}{3} + 8\sqrt{2}$$

Always draw a figure!

The key for setting up and solving a 3D integral is a good figure and the right coordinate system.

Problem:

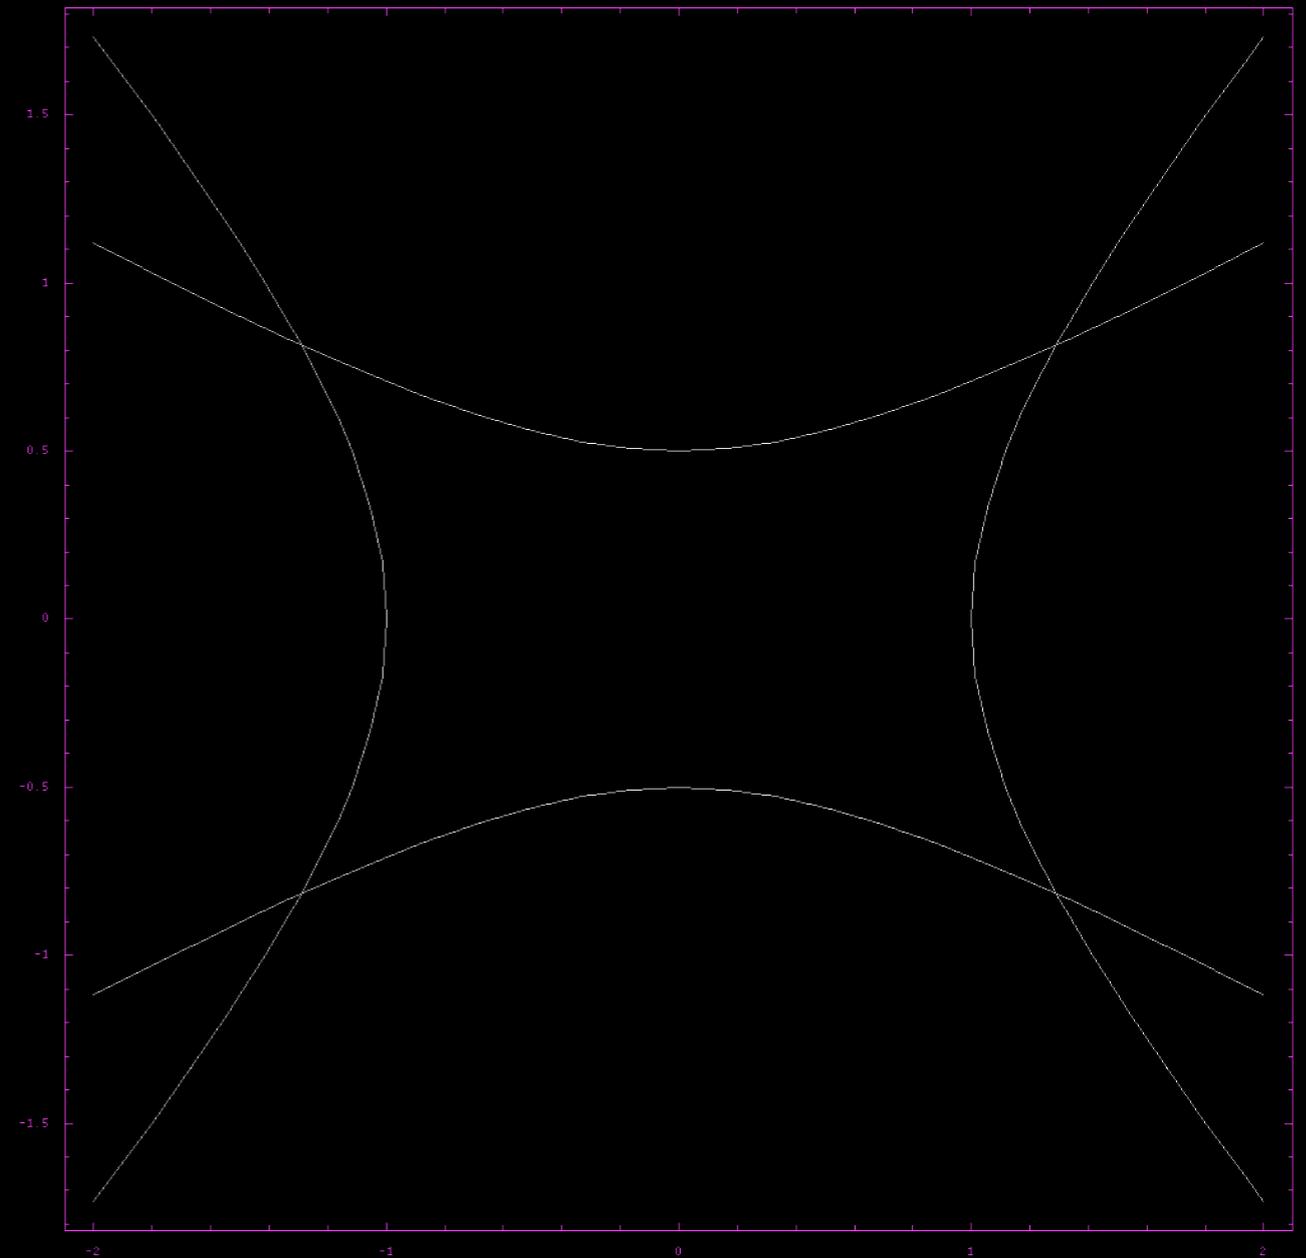

Find the volume
of the solid bound
by the one
sheeted
hyperboloid

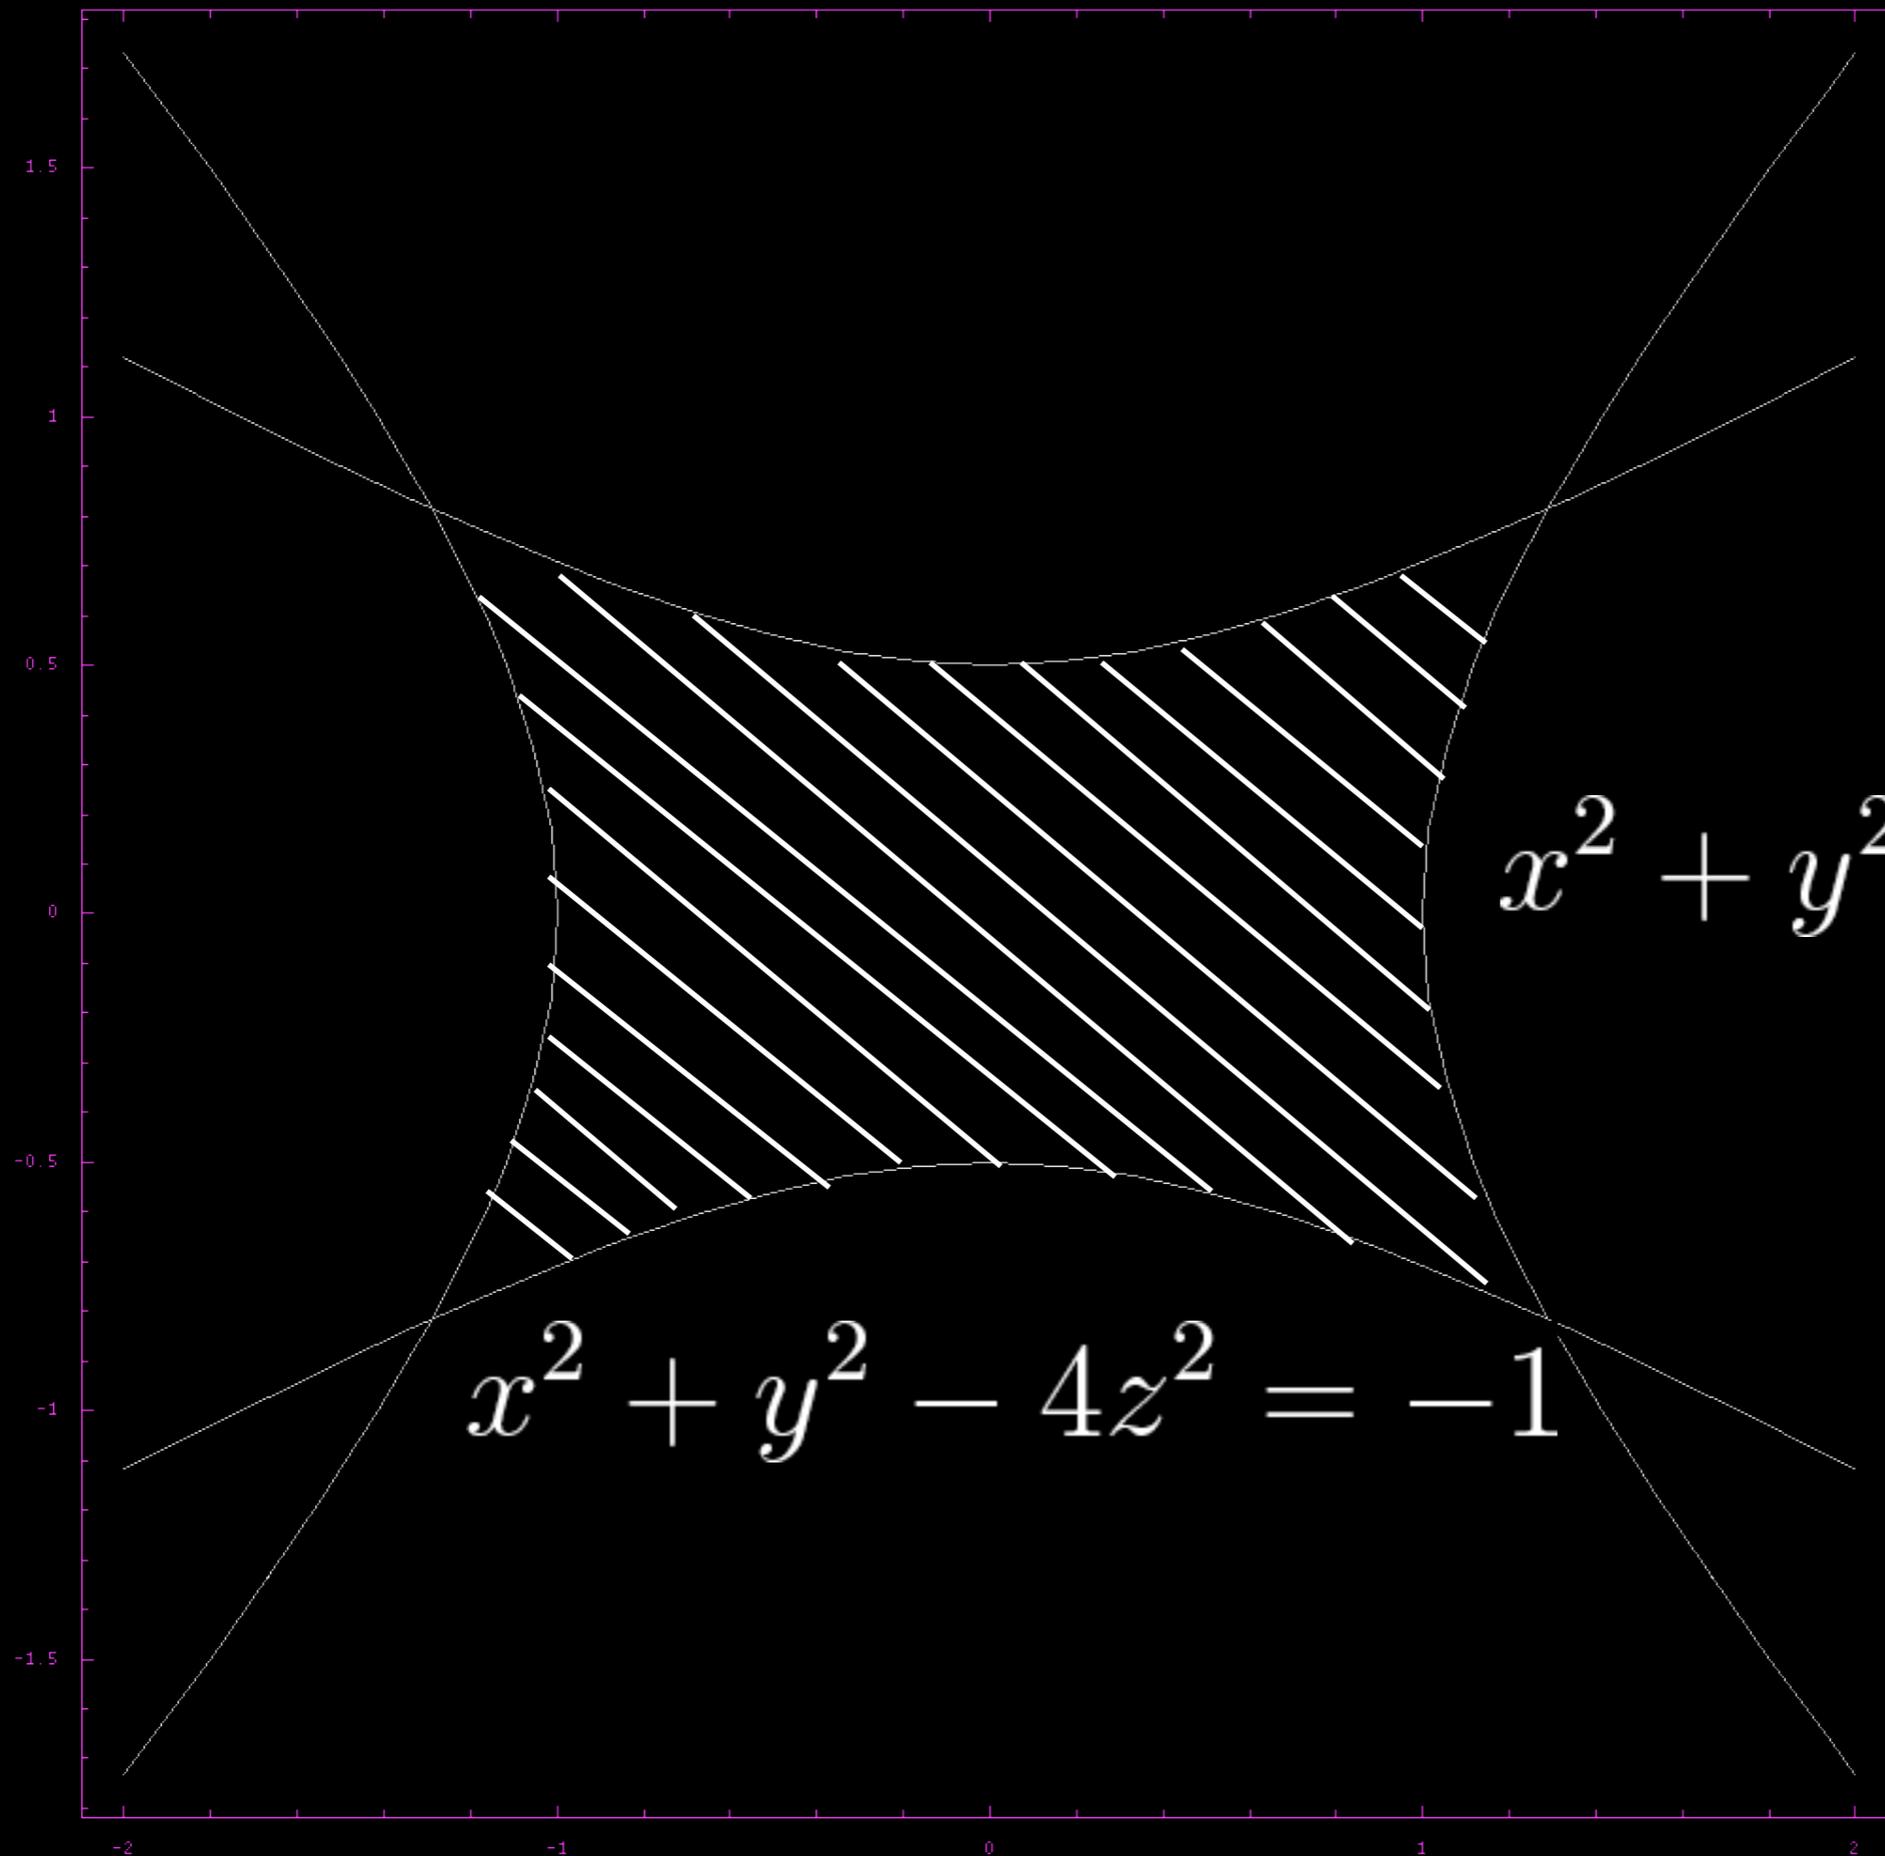

$$x^2 + y^2 - z^2 = 1$$

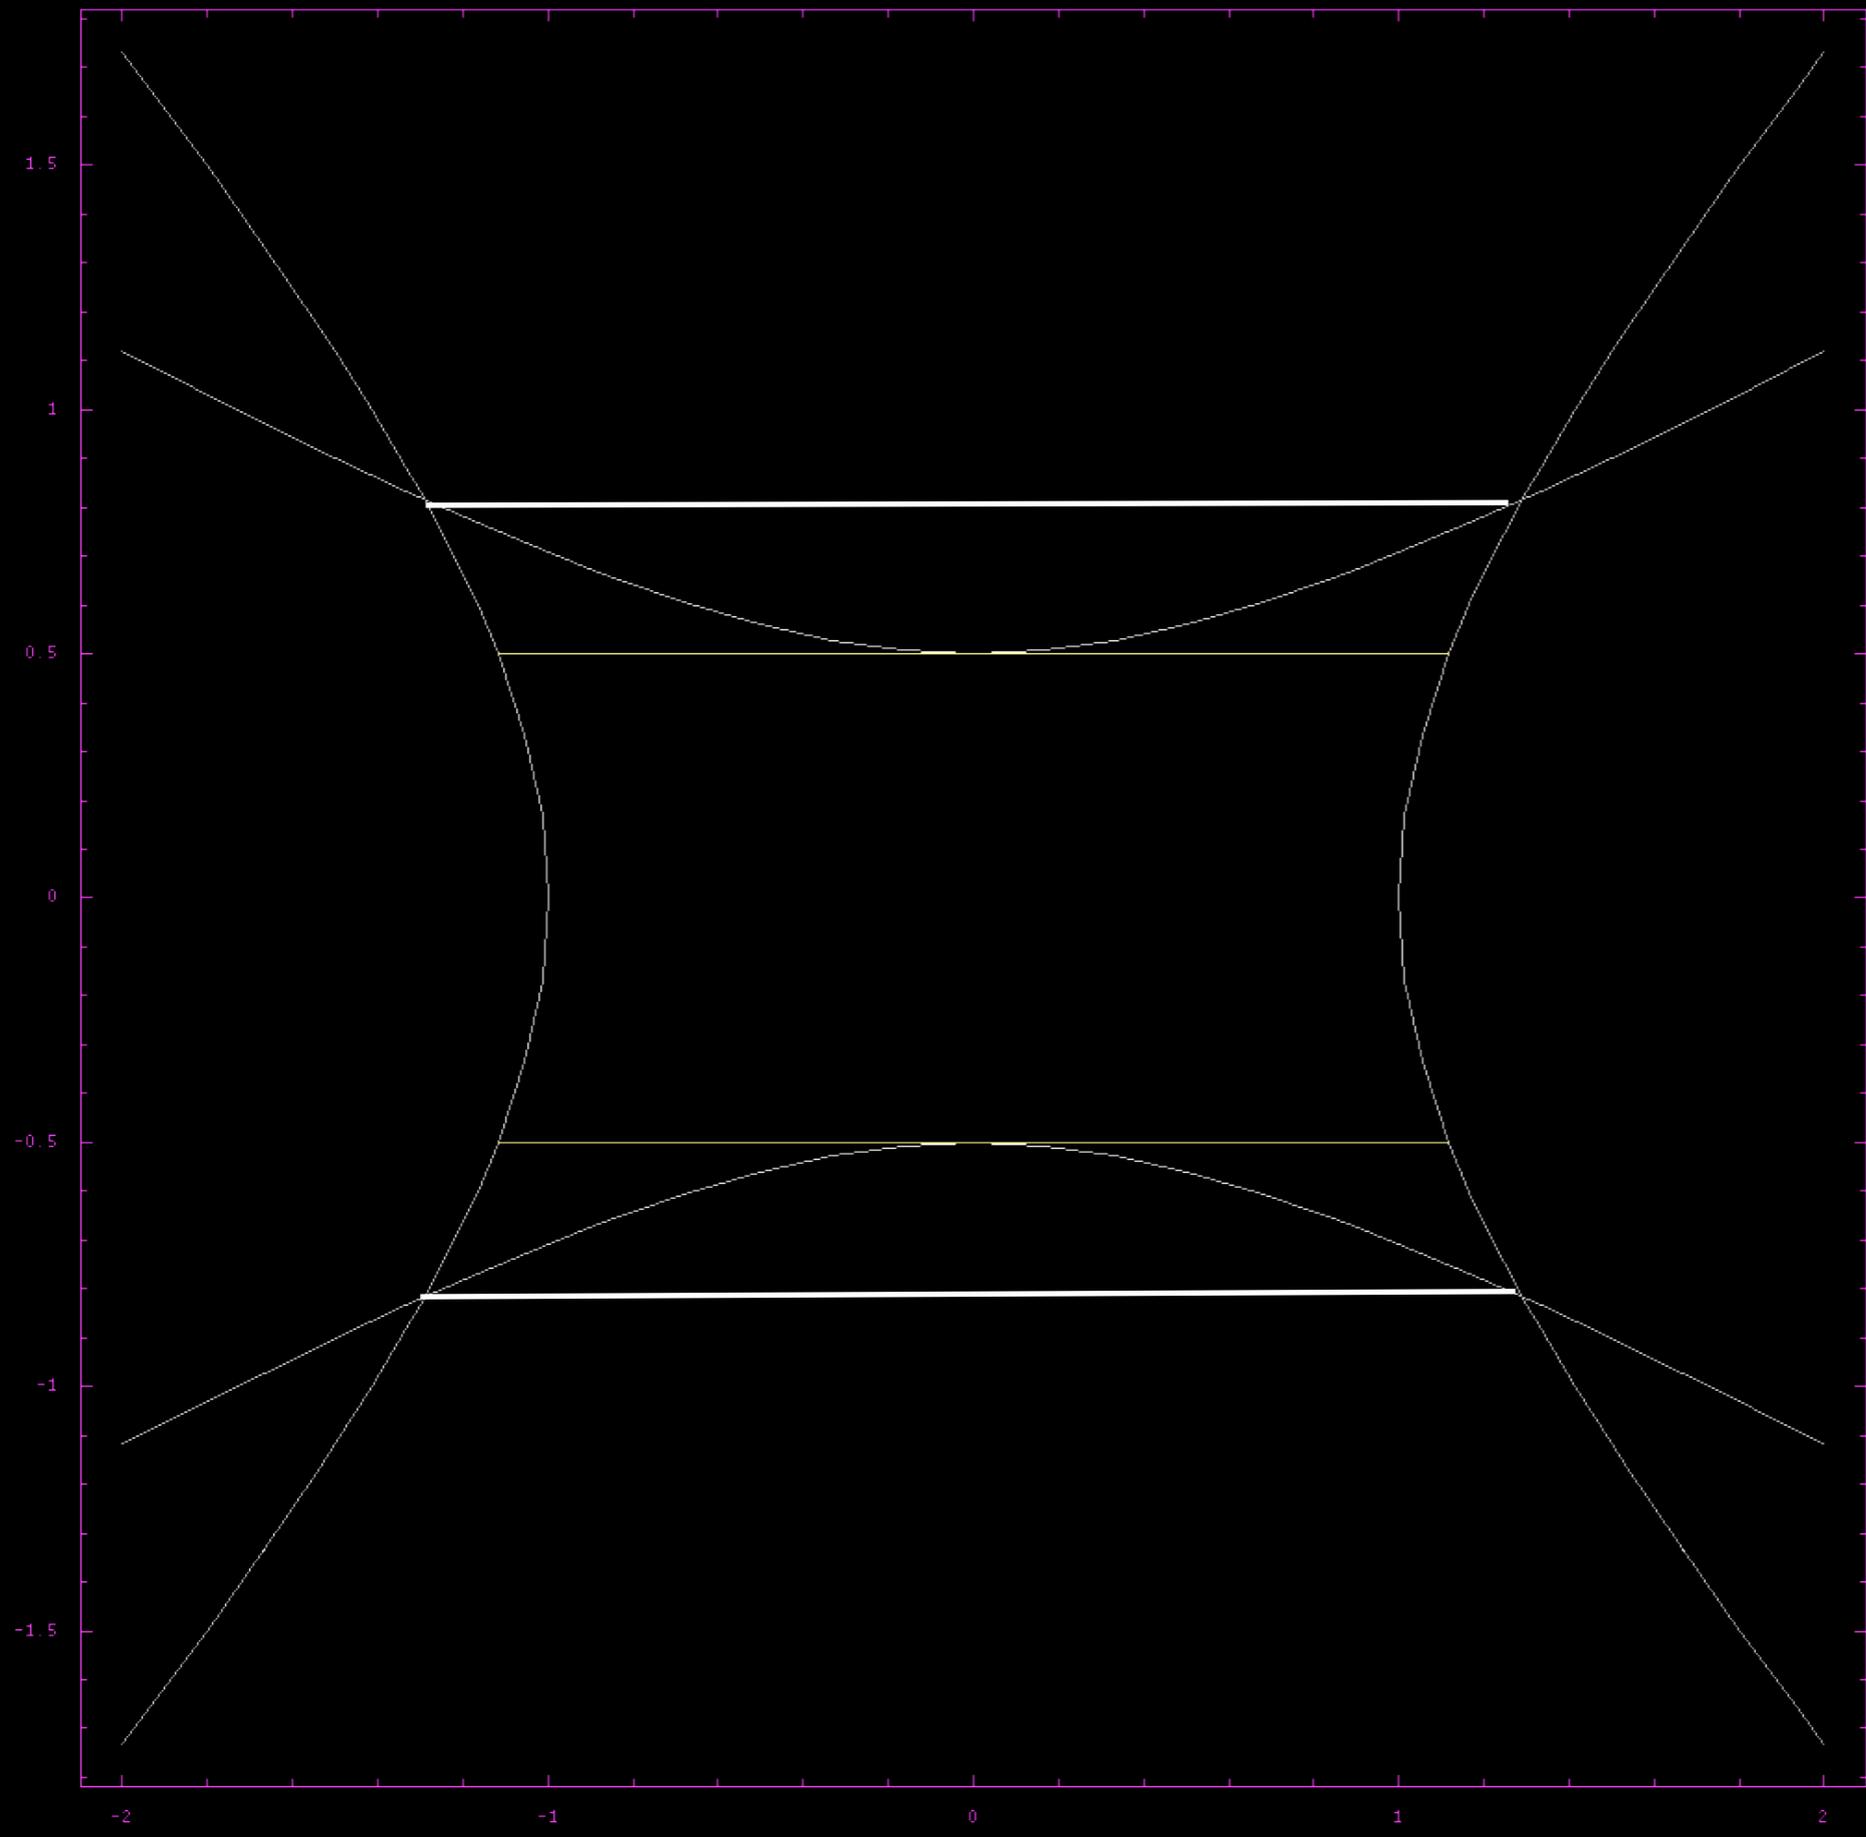

and the two sheeted
hyperboloid

$$x^2 + y^2 - 4z^2 = -1$$

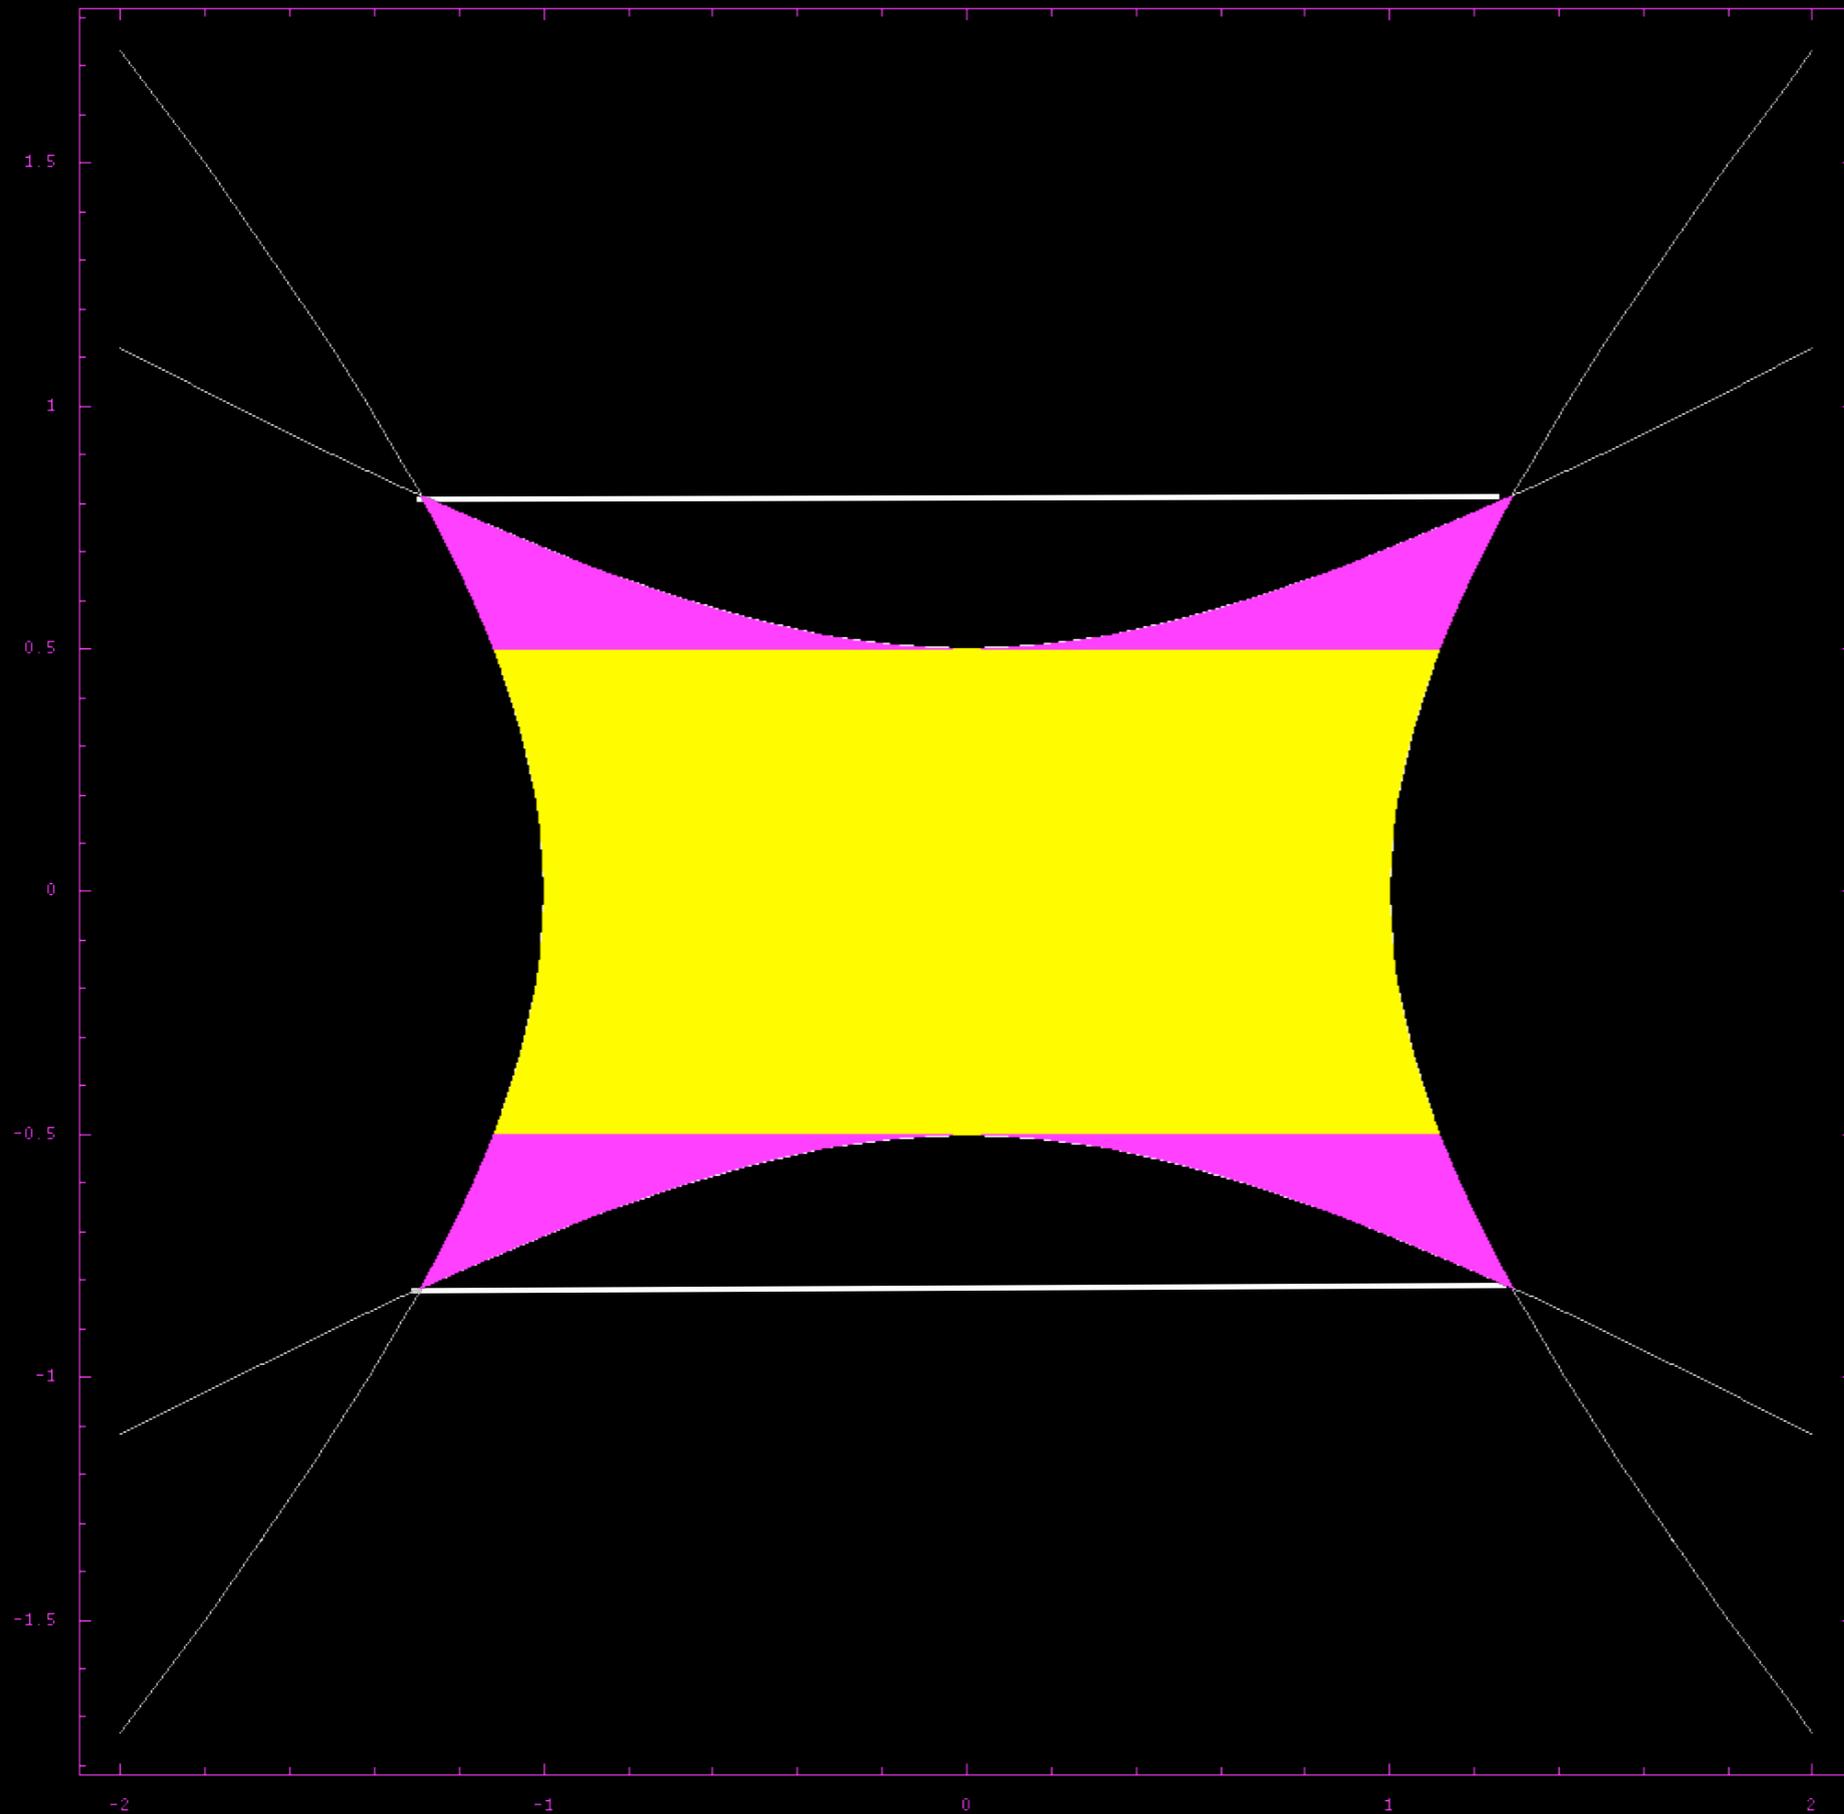

It is crucial to have a
good picture

$\sqrt{2/3}$
 $1/2$
 $-1/2$
 $-\sqrt{2/3}$

$$\sqrt{\frac{2}{3}}$$

$$1/2$$

$$1/2$$

$$-1/2$$

$$-\sqrt{\frac{2}{3}}$$

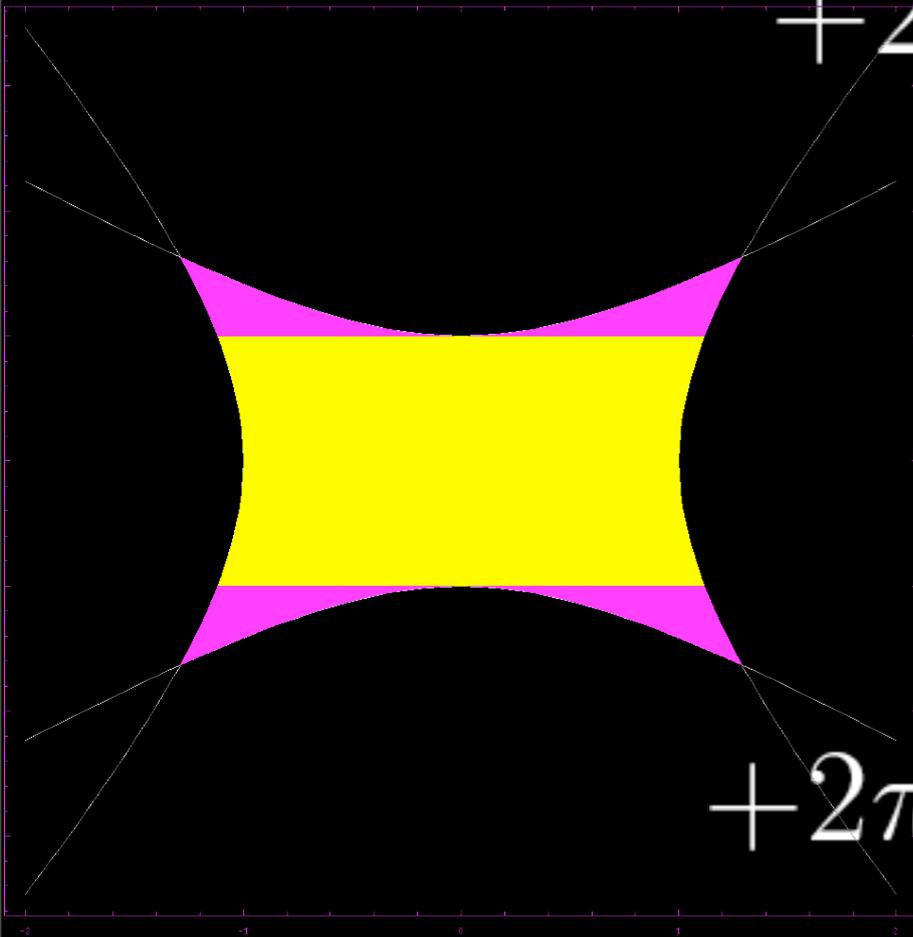

$$2 \int_0^{1/2} \int_0^{\sqrt{1+z^2}} \int_0^{2\pi} r \, d\theta \, dr \, dz$$

$$+ 2 \int_{1/2}^{\sqrt{2/3}} \int_{\sqrt{-1+4z^2}}^{\sqrt{1-z^2}} \int_0^{2\pi} r \, d\theta \, dr \, dz$$

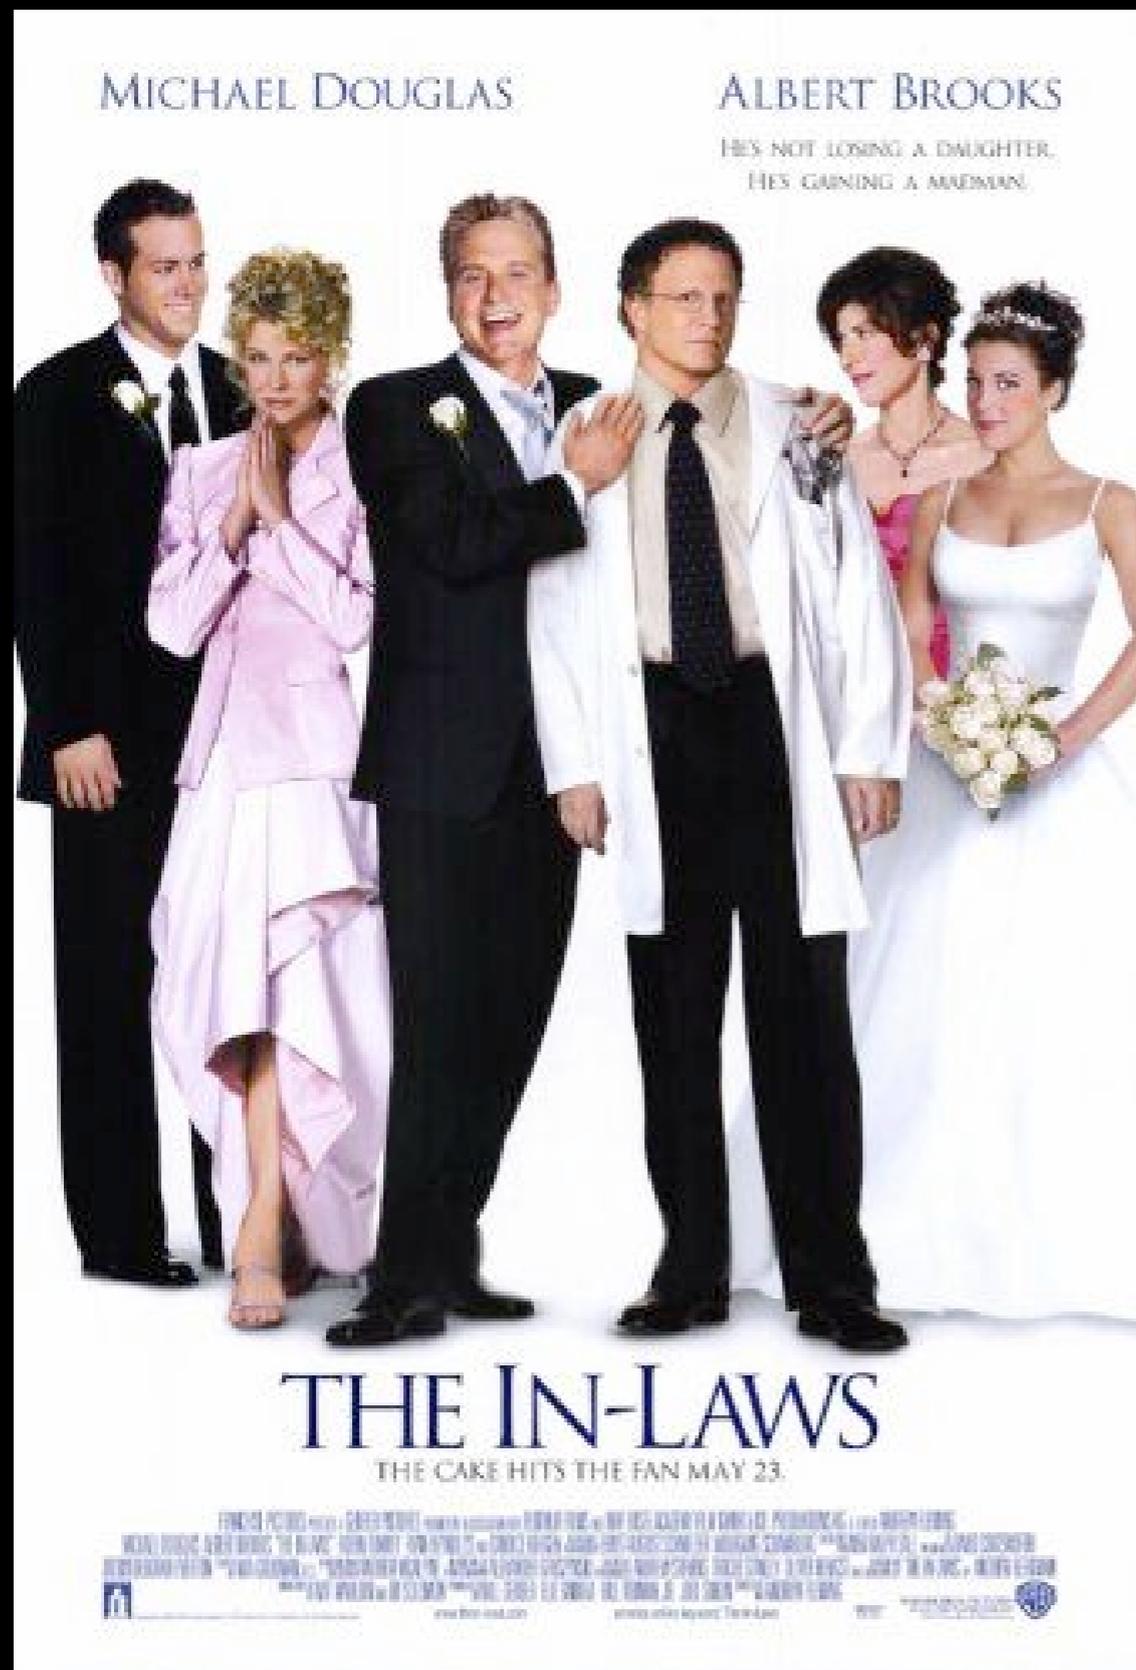

$$= 2 \int_0^{1/2} \pi(1+z^2) \, dz$$

$$+ 2\pi \int_{1/2}^{\sqrt{2/3}} (1+z^2) - (-1+4z^2) \, dz$$

$$= \pi \, 13/12 \quad + \quad (32 \sqrt{6} - 63)/36 \quad \pi$$

The inlaws

Let V be the integral of

$$f(x, y, z) = x + y + z + 1/(7\pi)$$

over the ball with
radius $1/2$. What is $1/V$?

Answer:

We don't know the
ultimate question. But we
have the ultimate advise

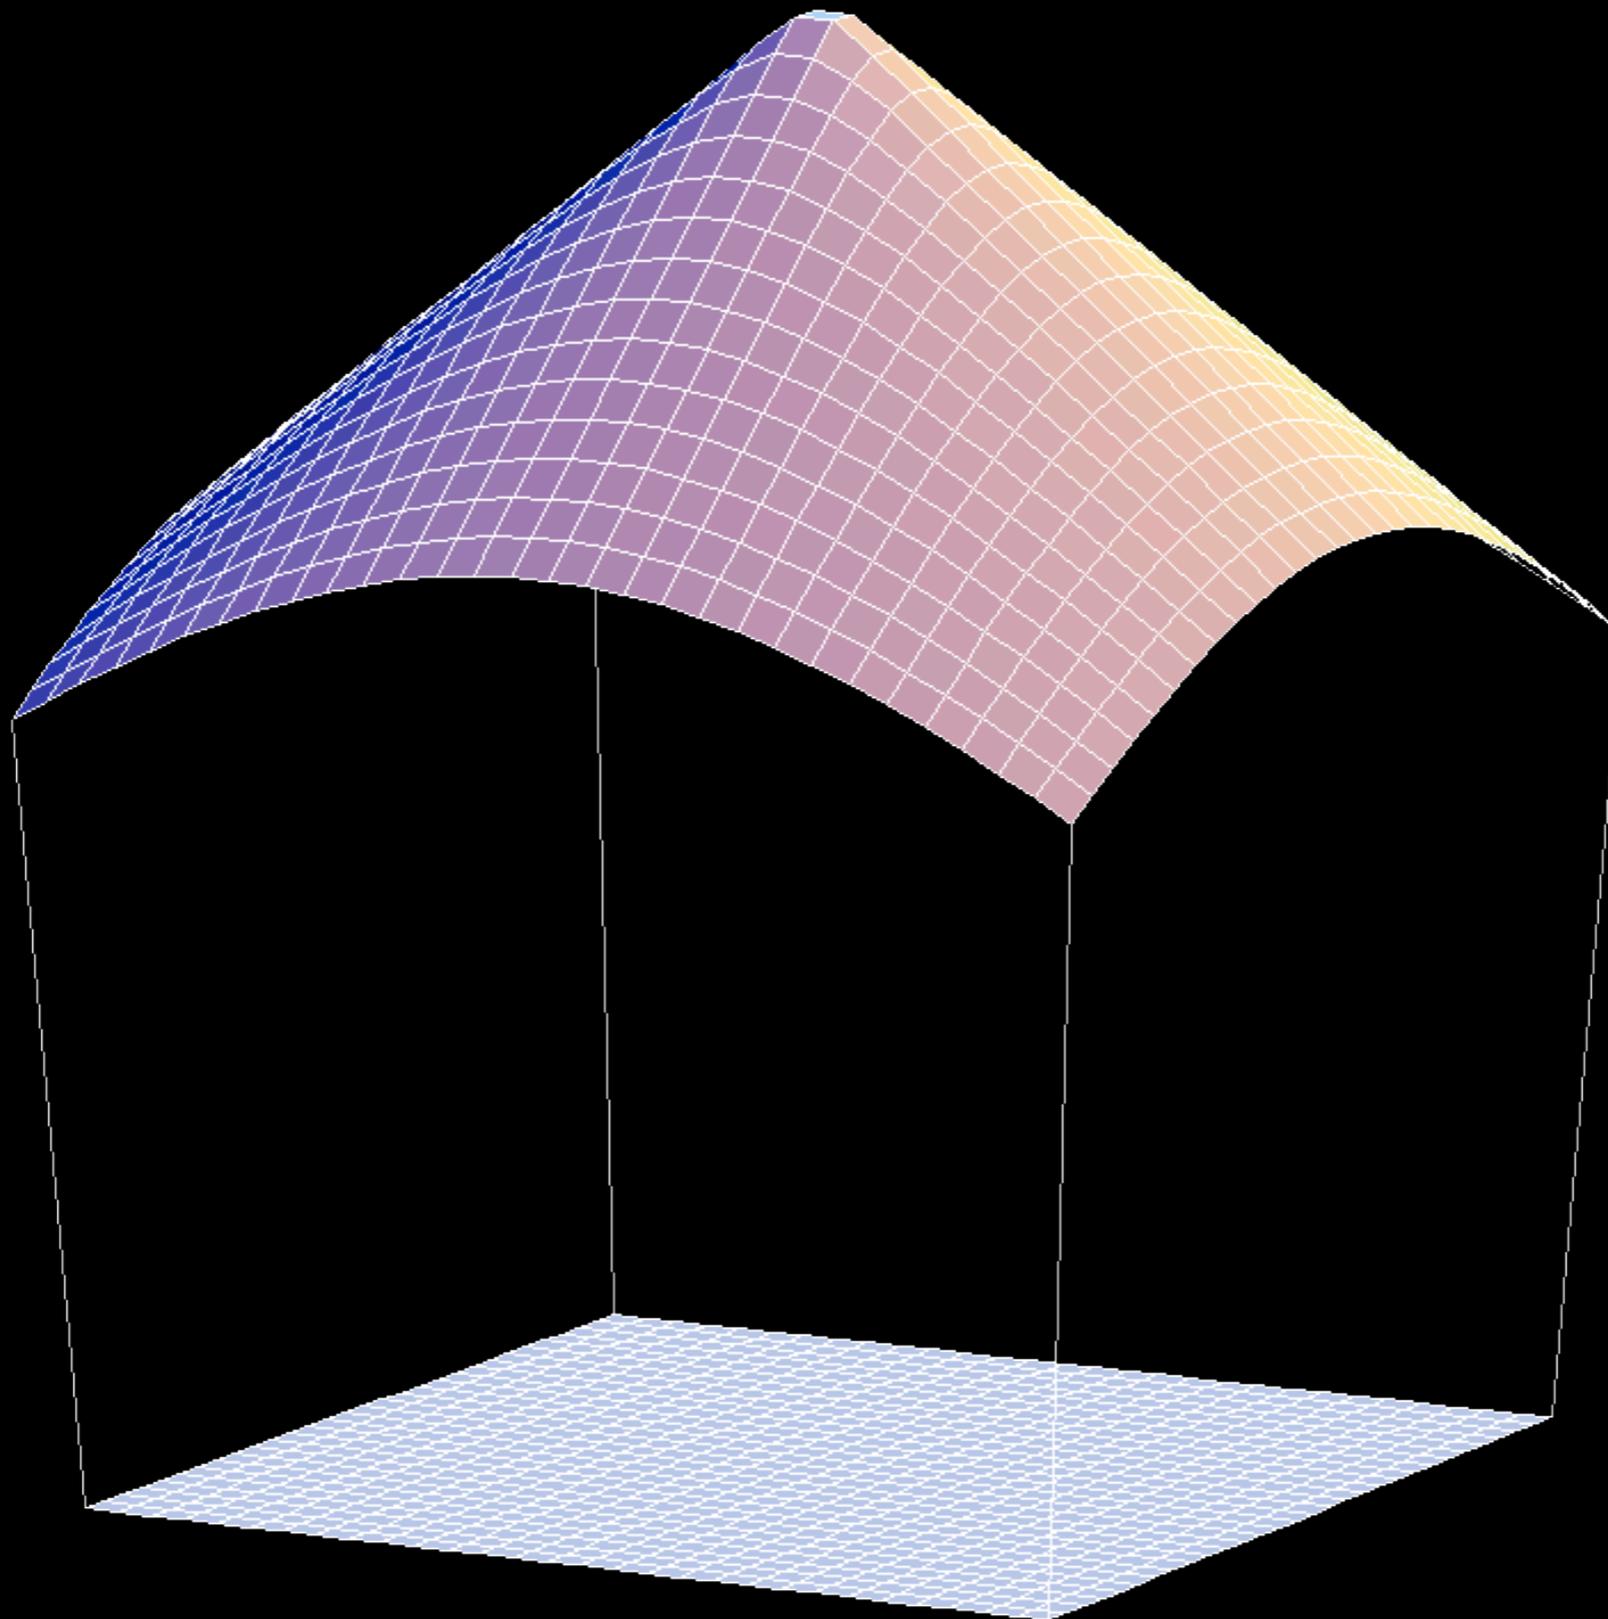

- Make a good picture
- Consider other coordinate systems
- Switch order of integration if necessary

It is important, that if you
have a problem, like
computing the volume of

$$-1 < x < 1, -1 < y < 1, 0 < z < \sqrt{x^2 + y^2}$$

that you

Part III

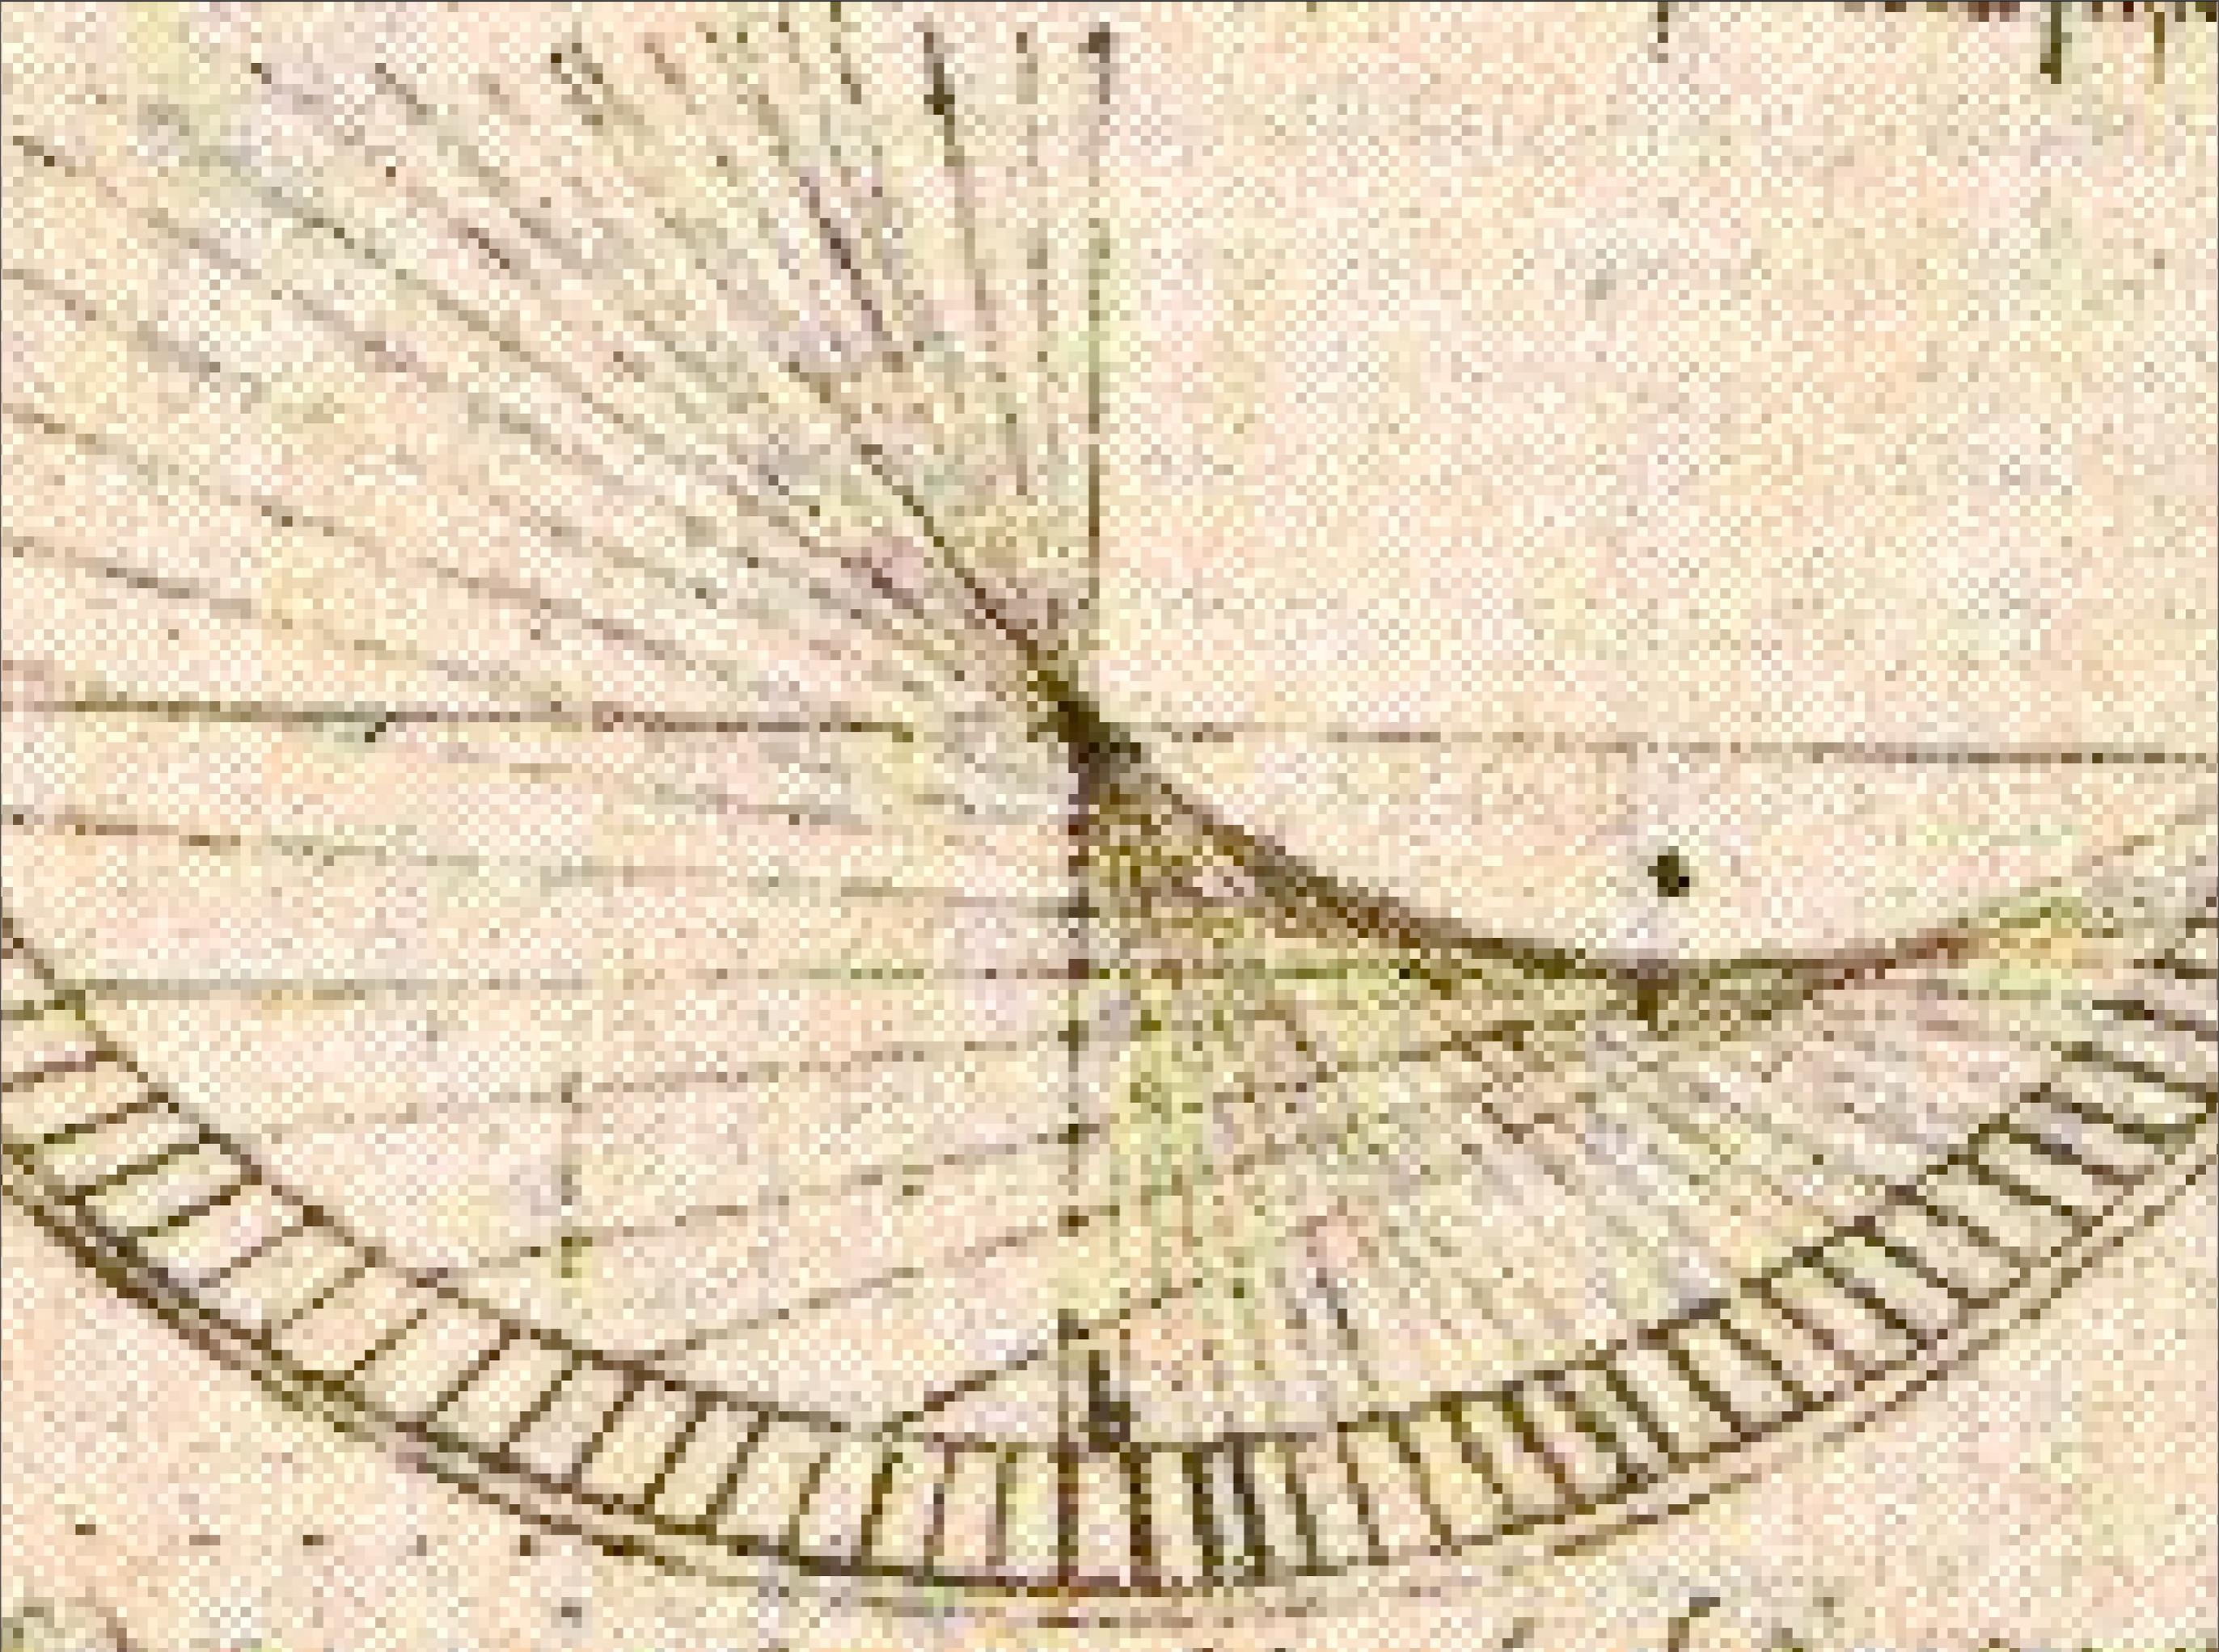

Oliver Knill, 1/10-11/2006

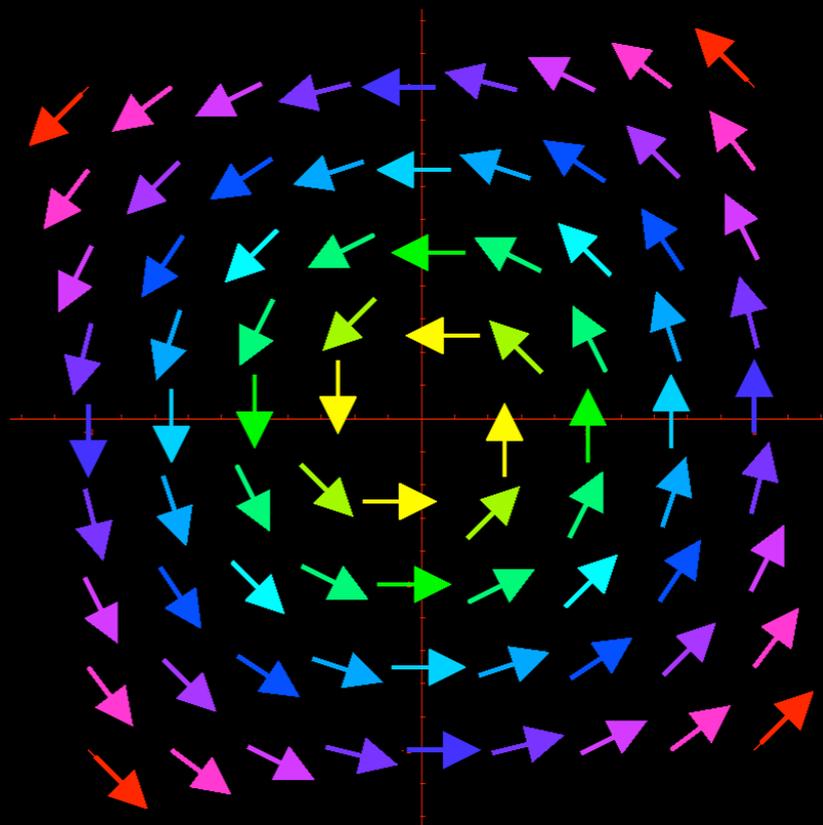

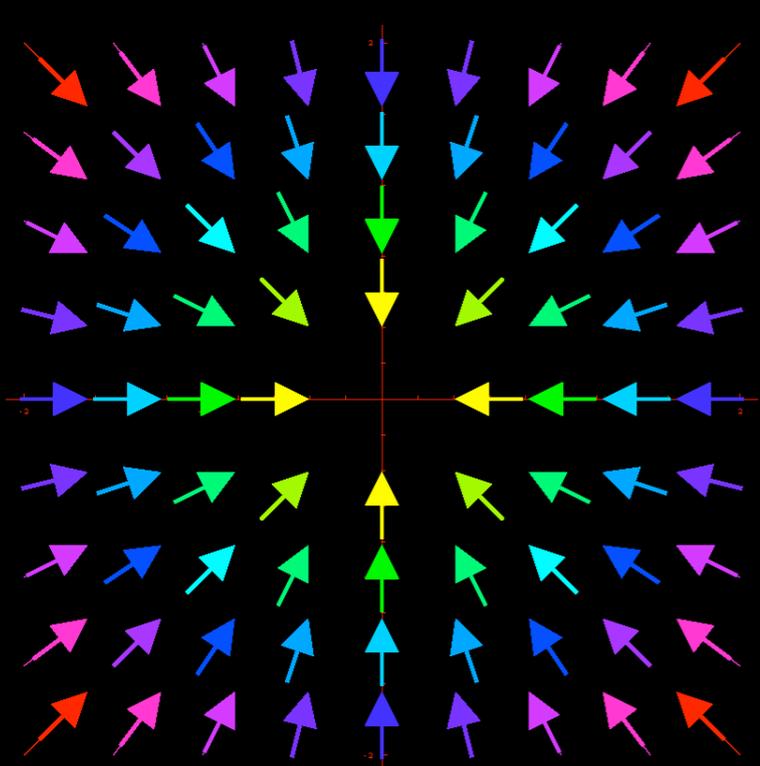

Vector Fields

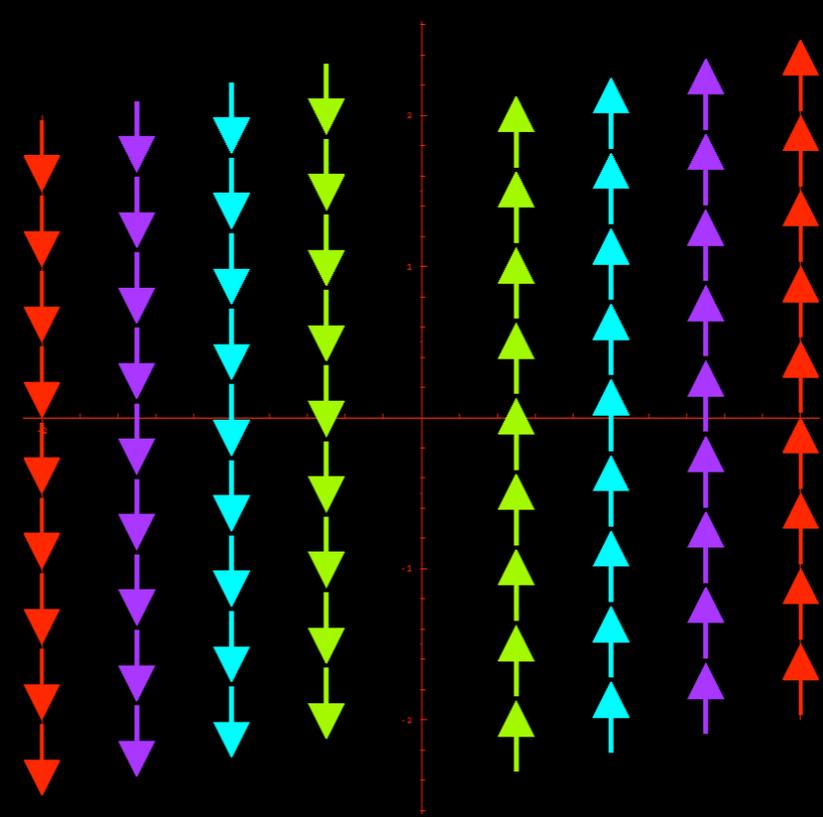

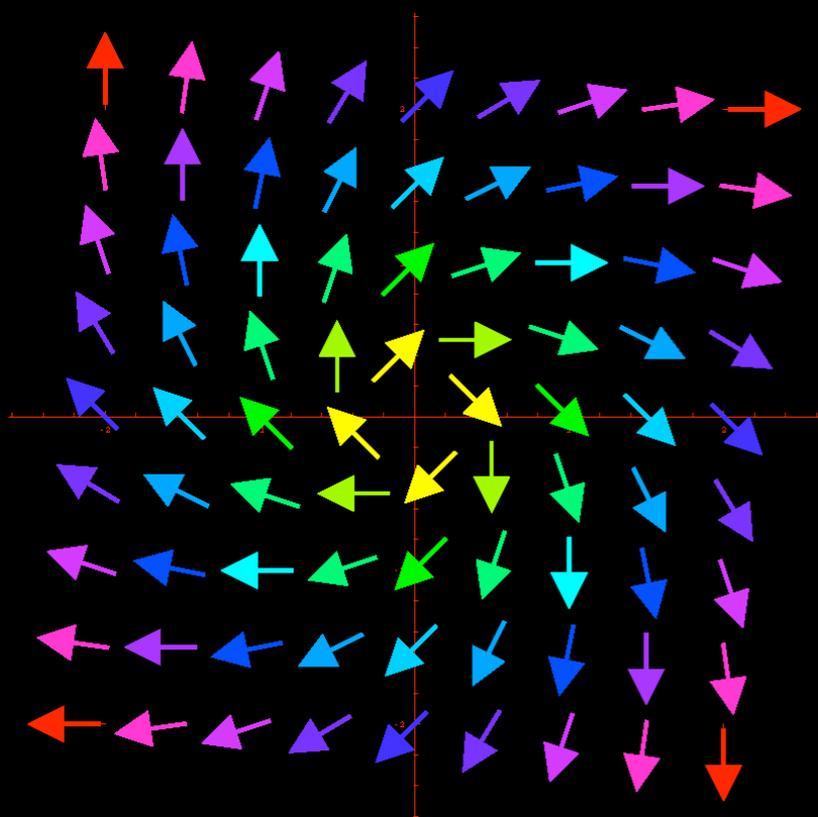

Vector Fields

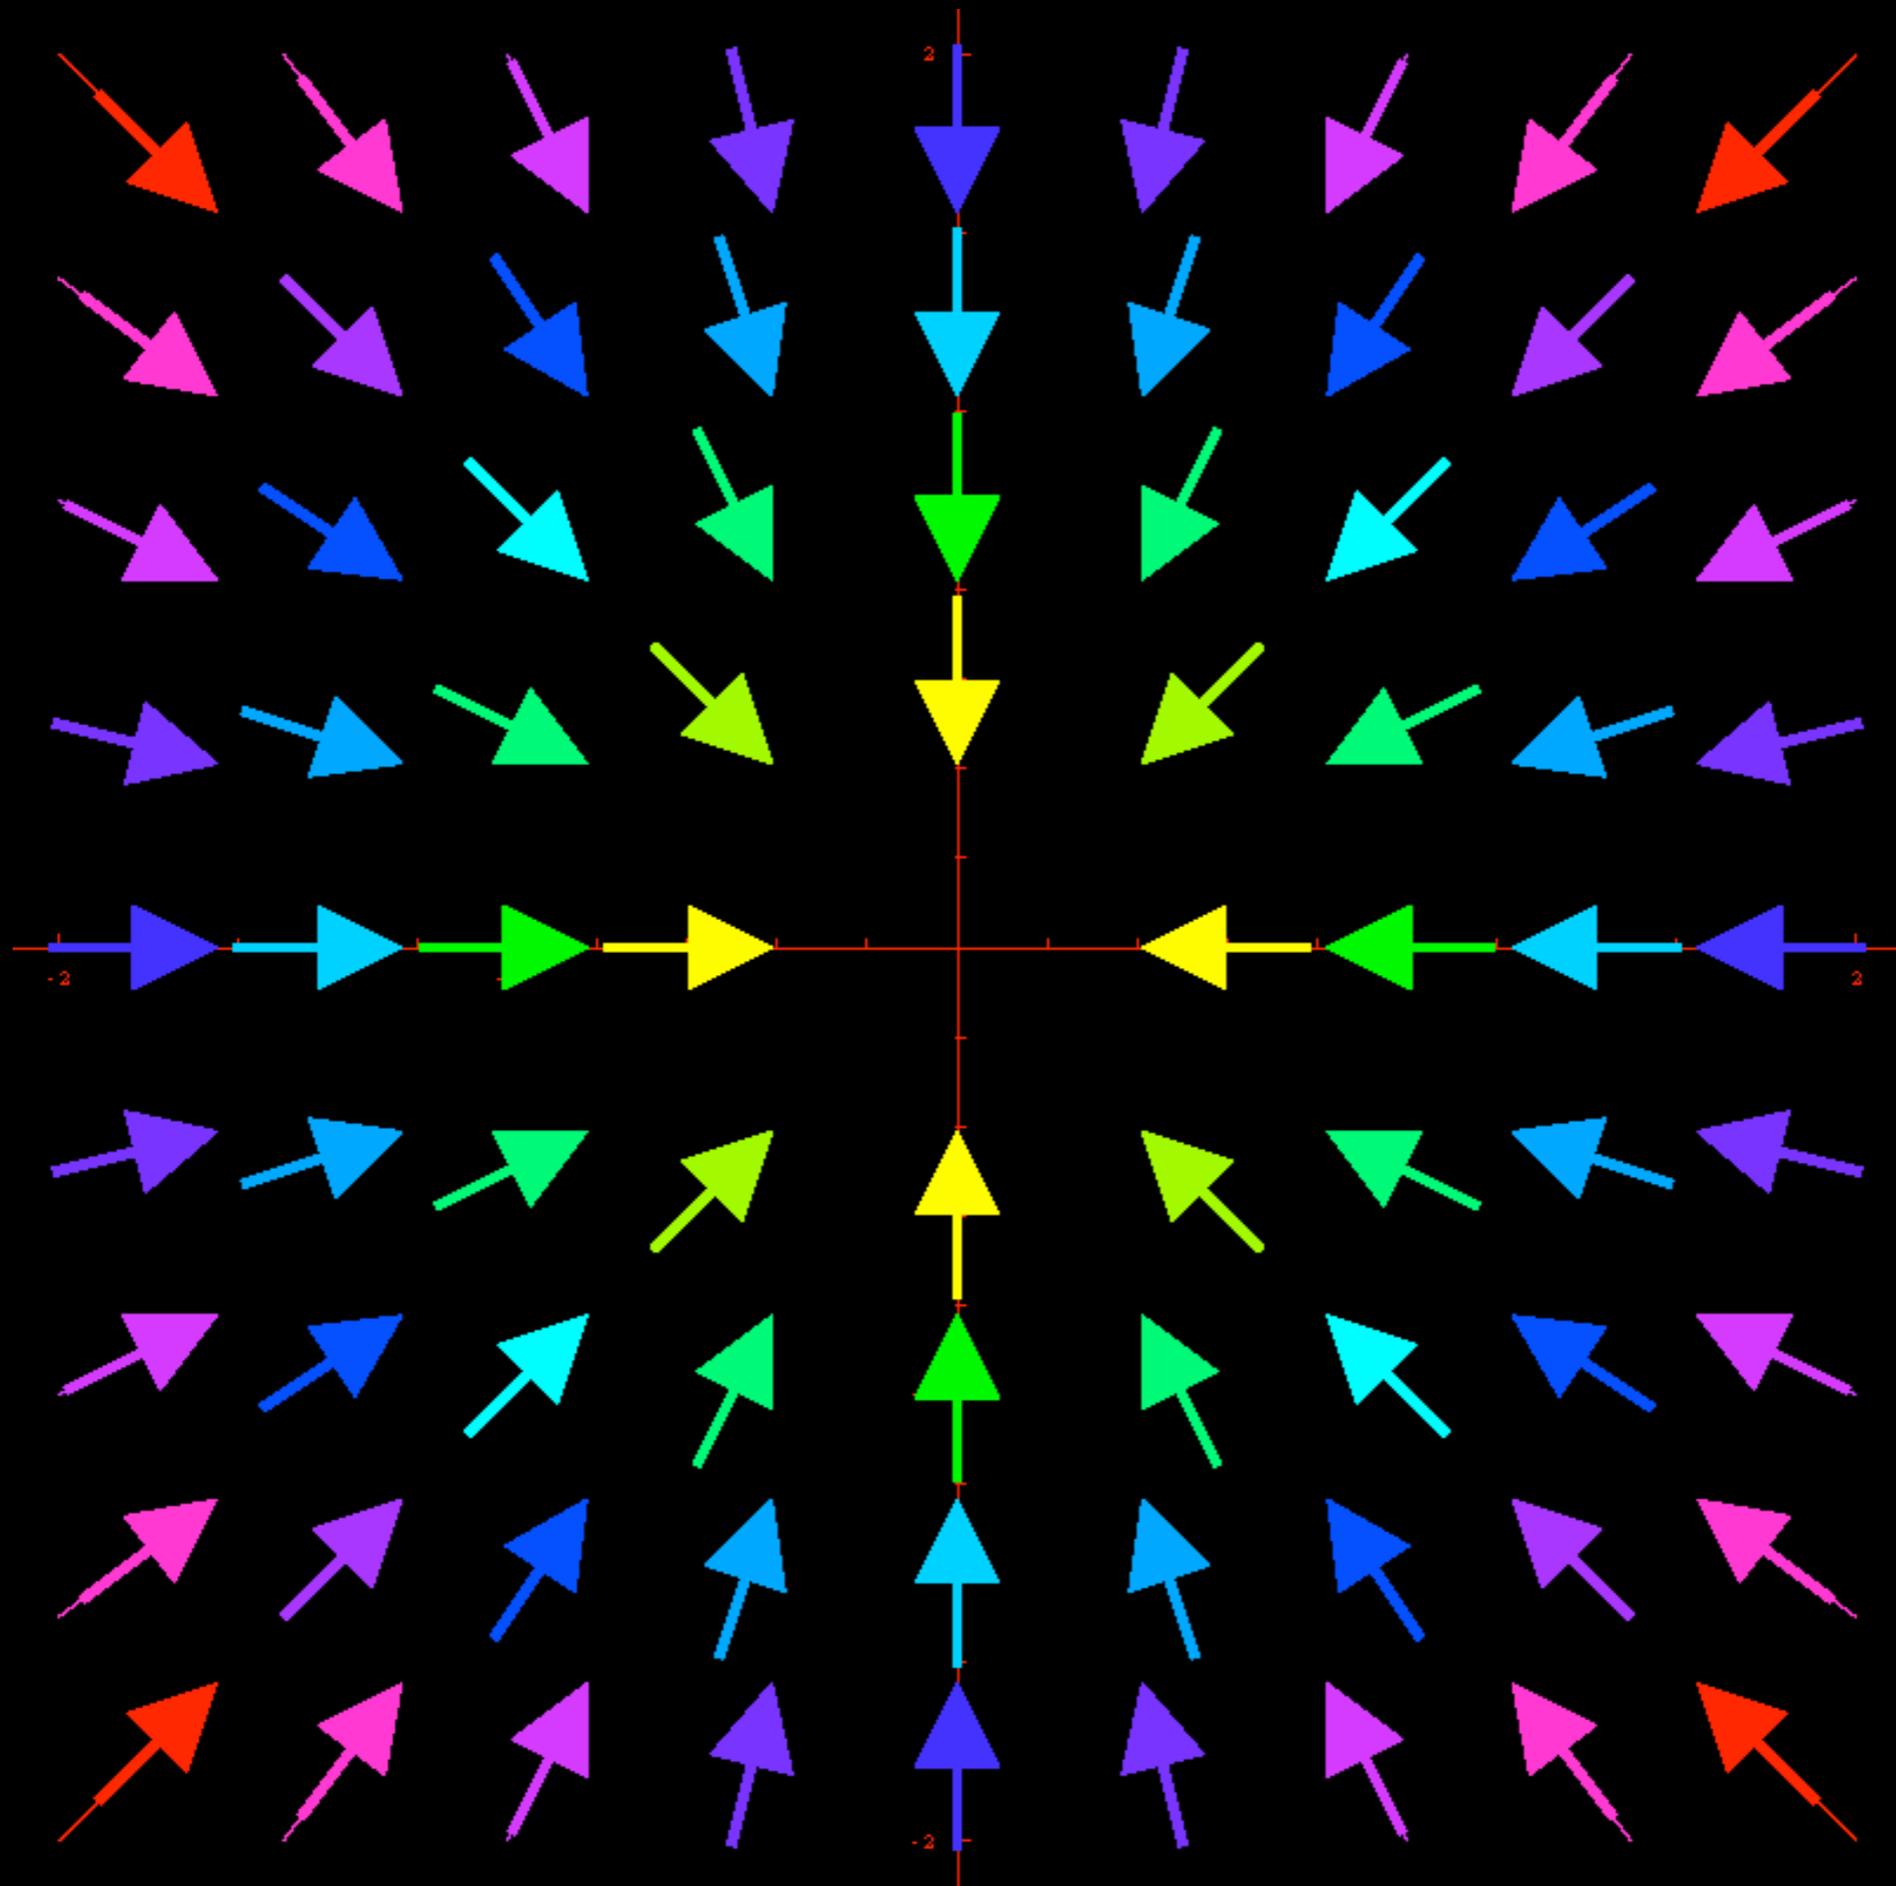

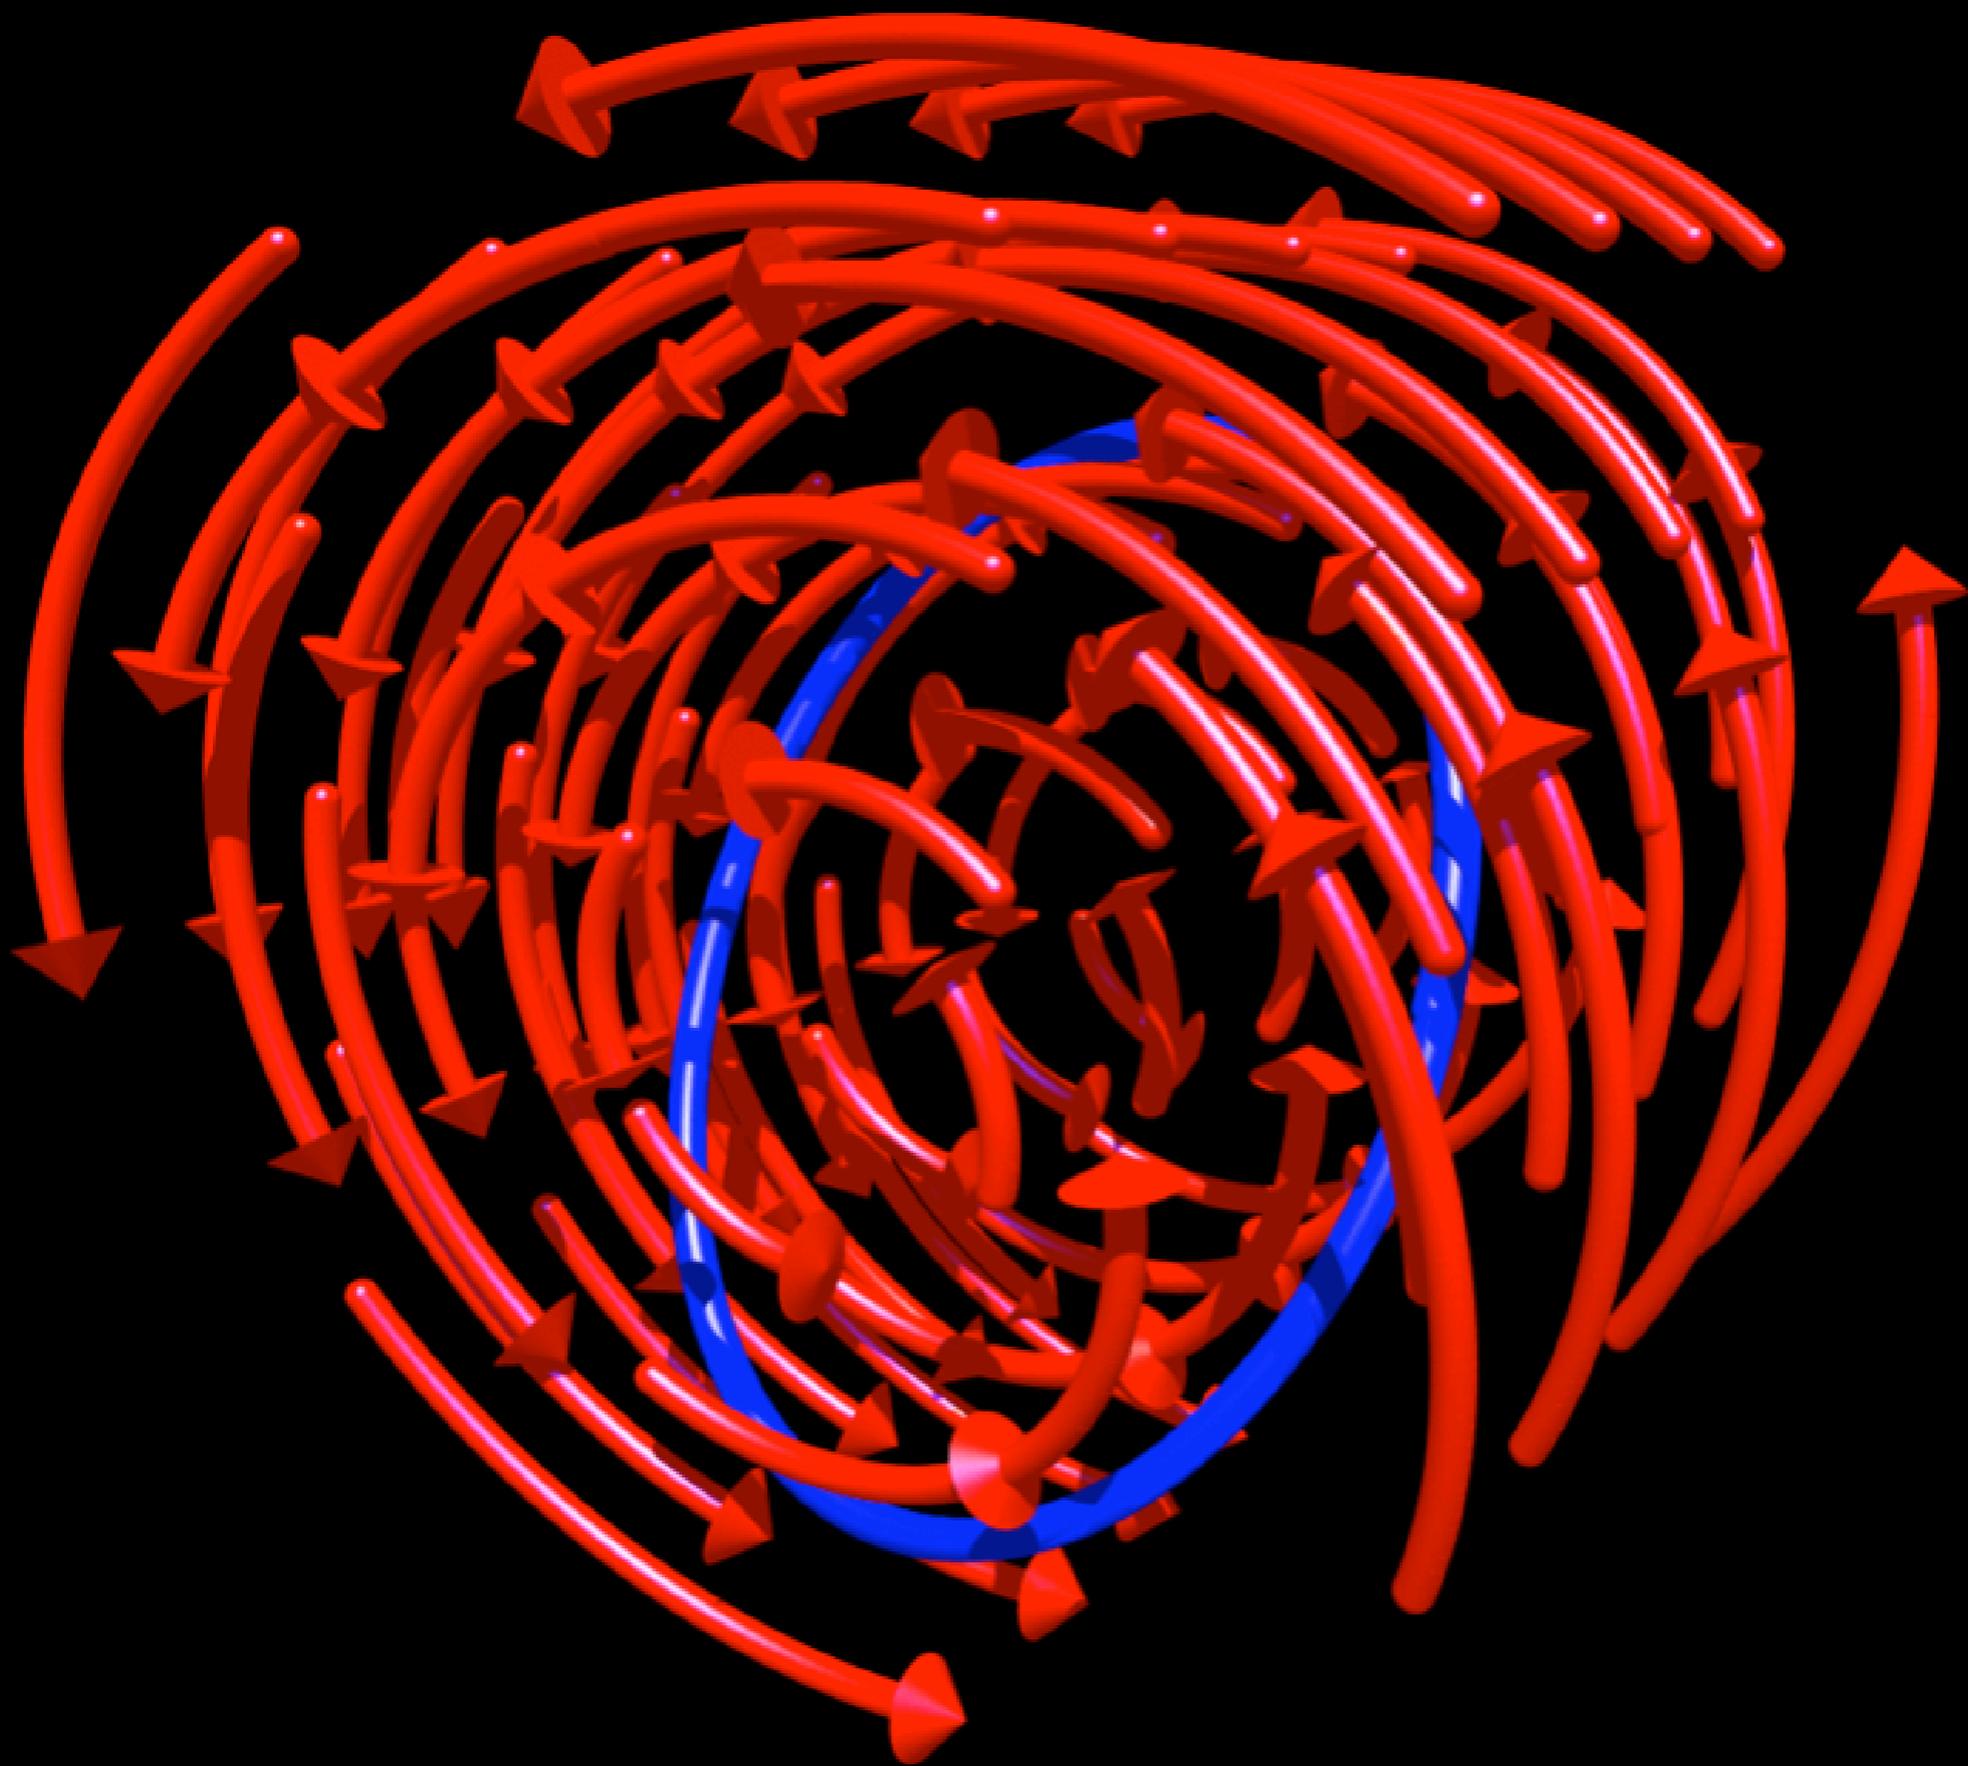

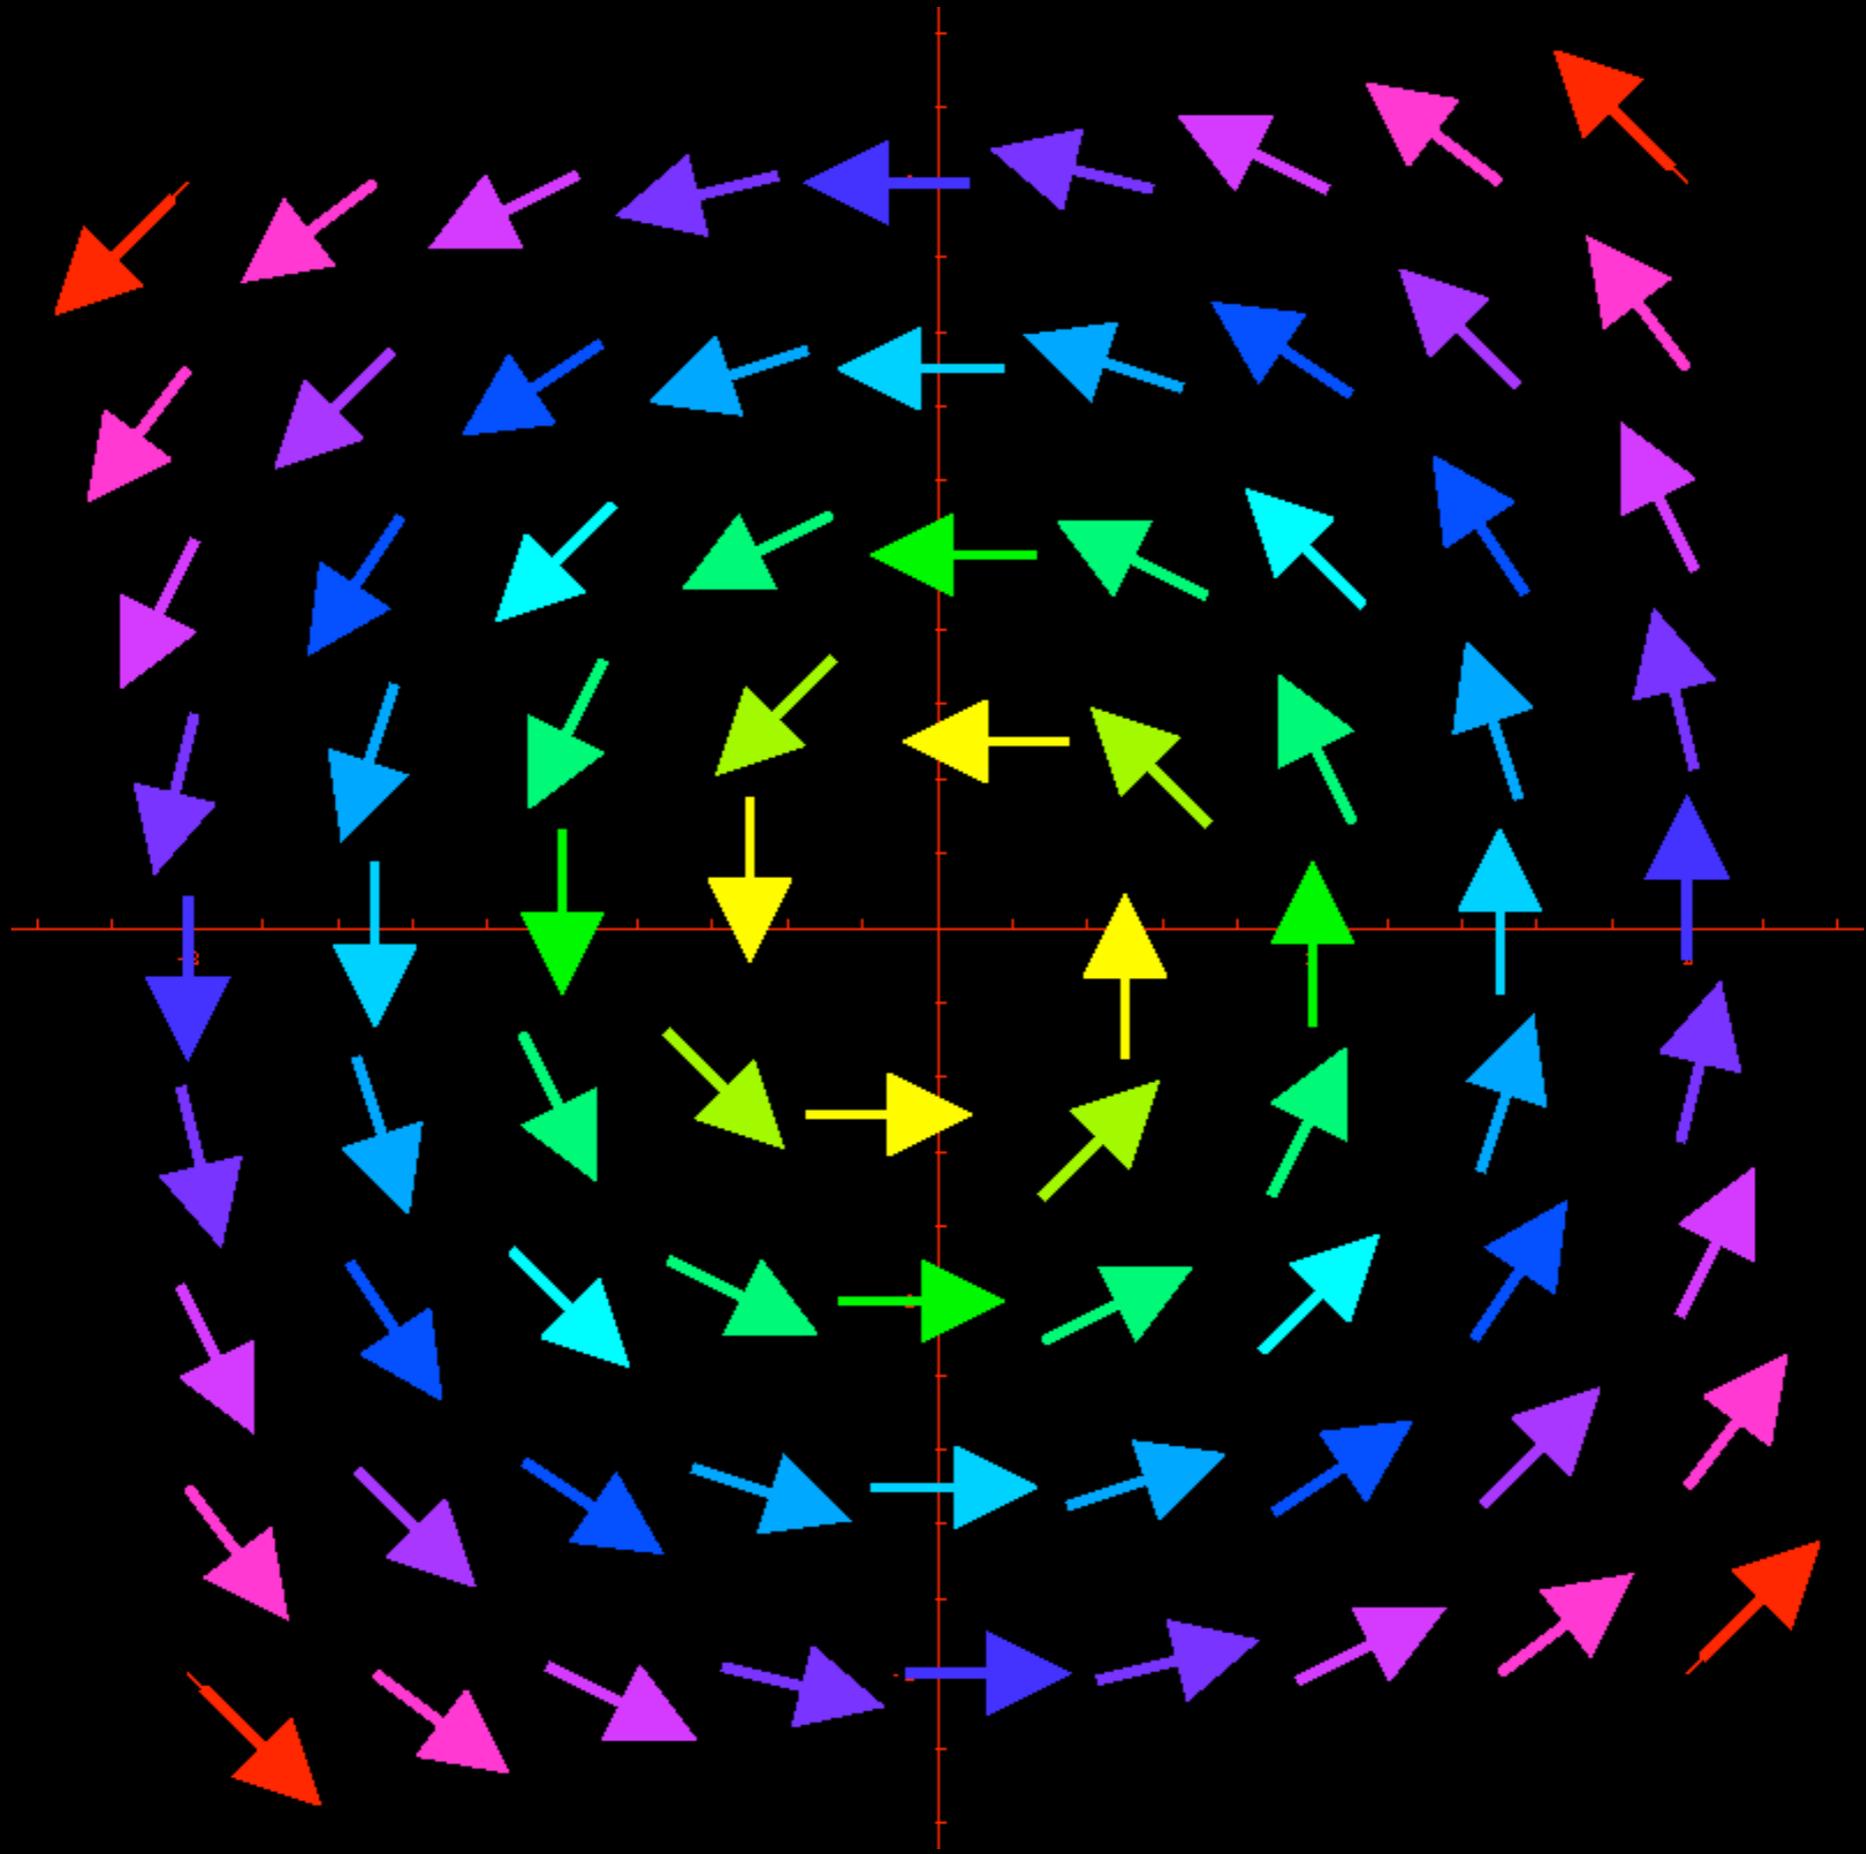

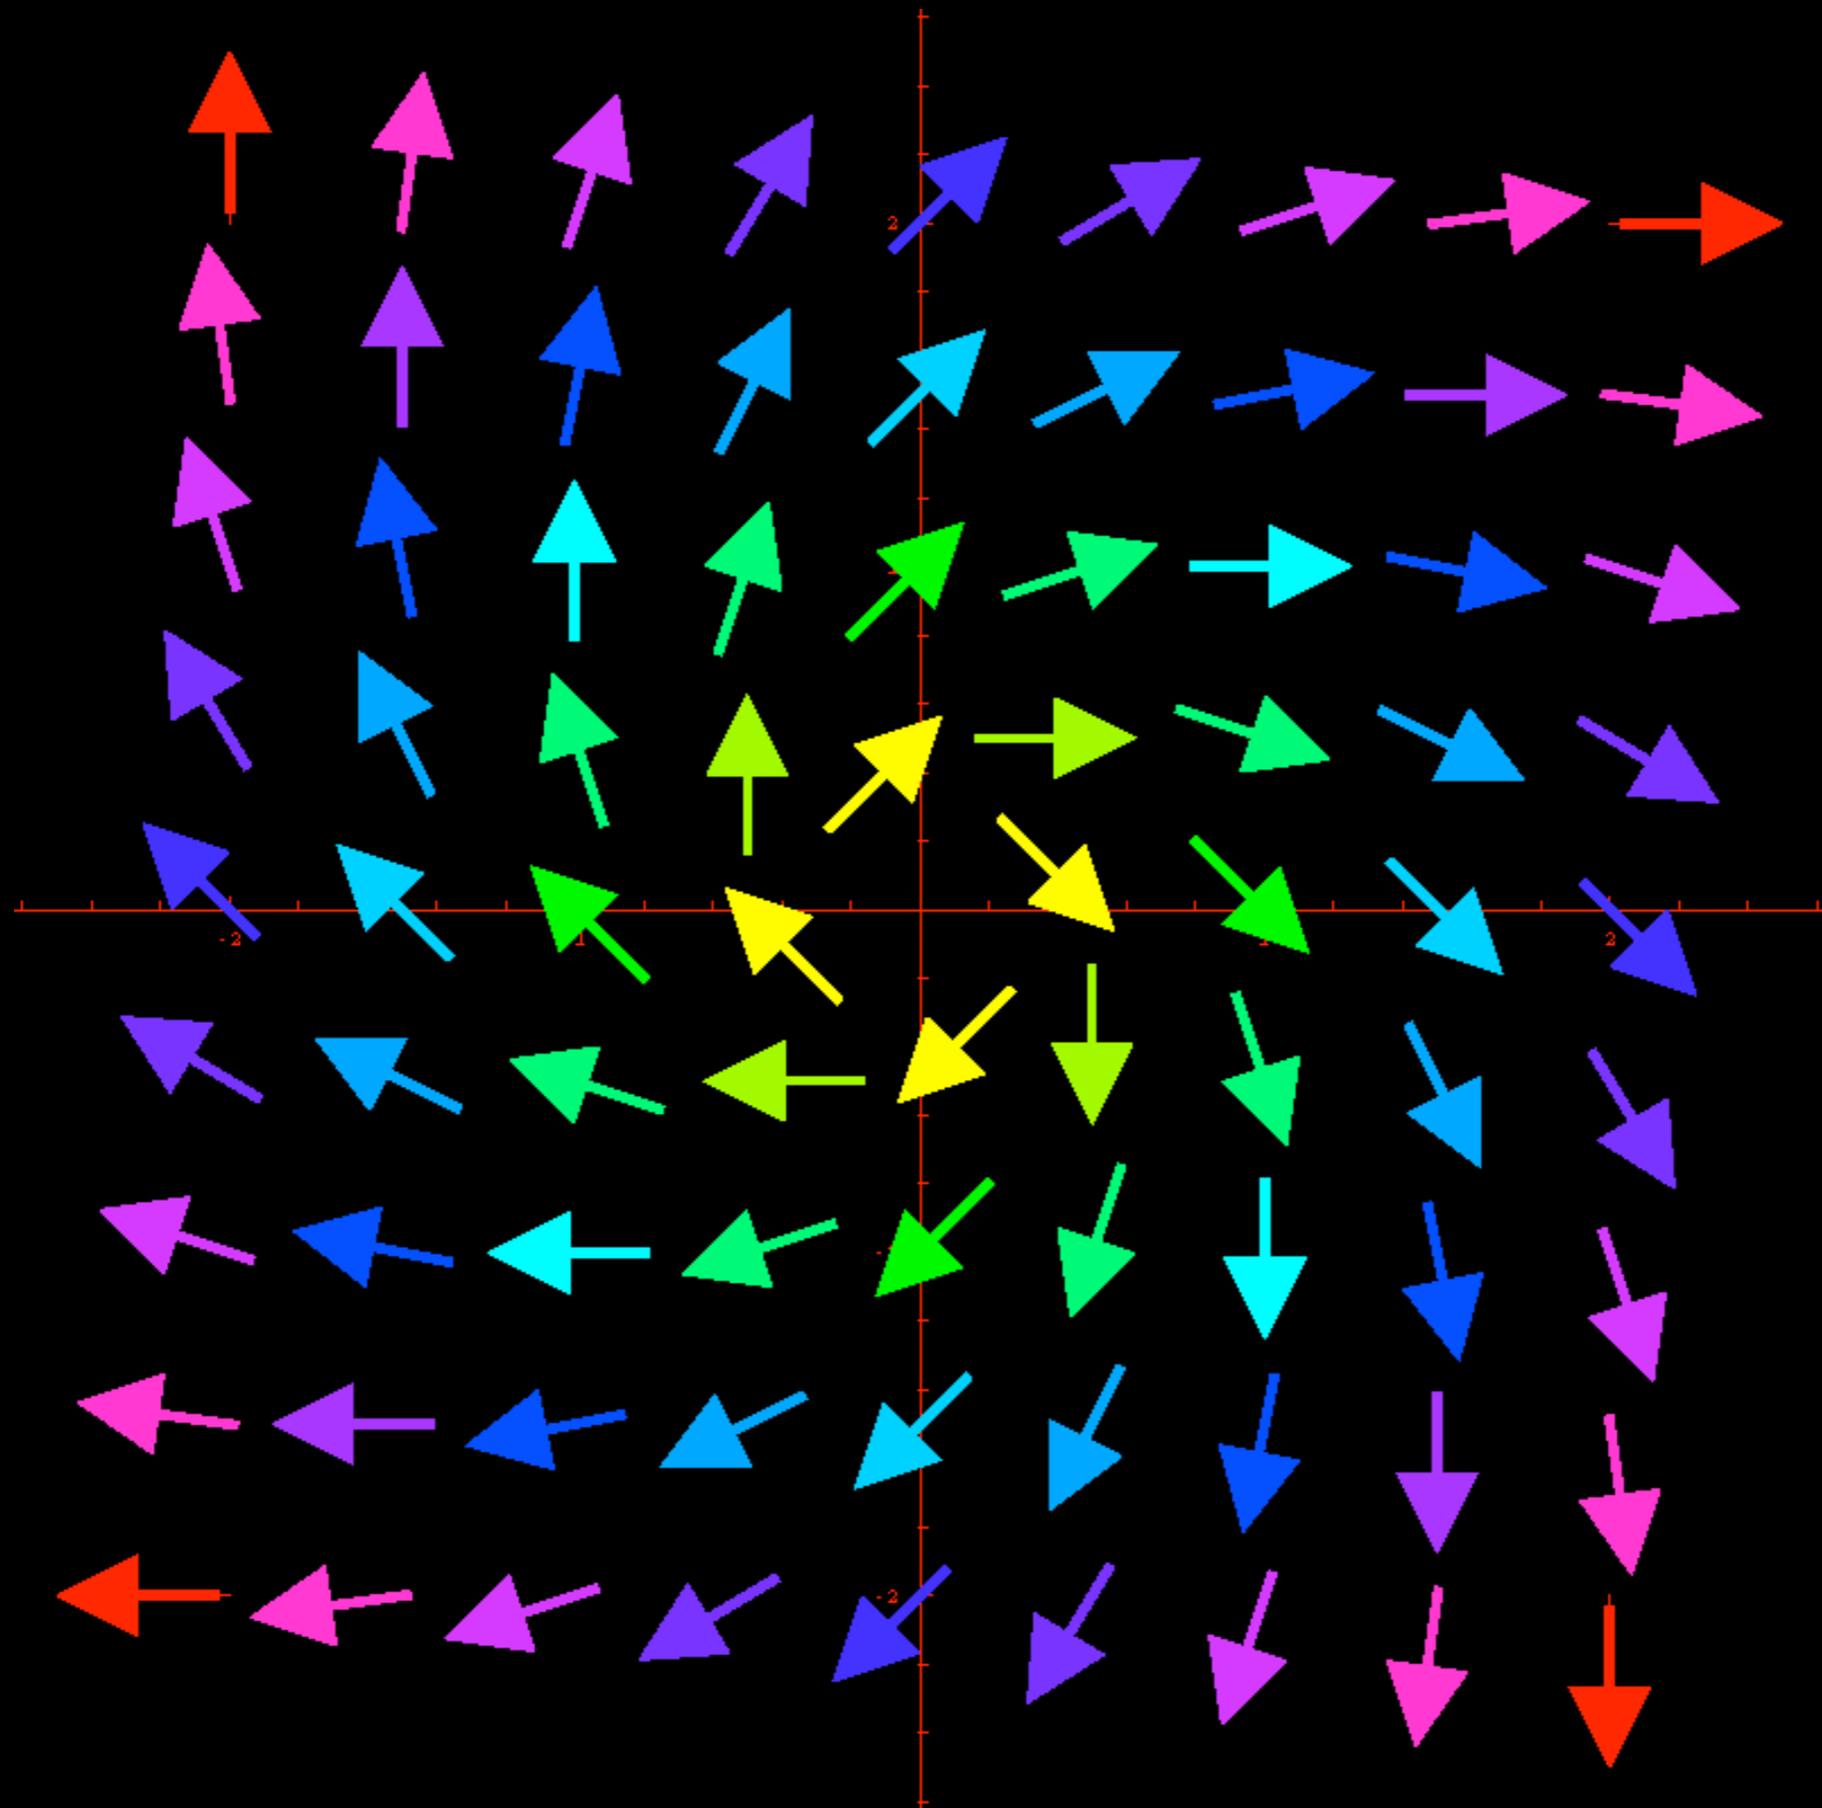

Vector fields

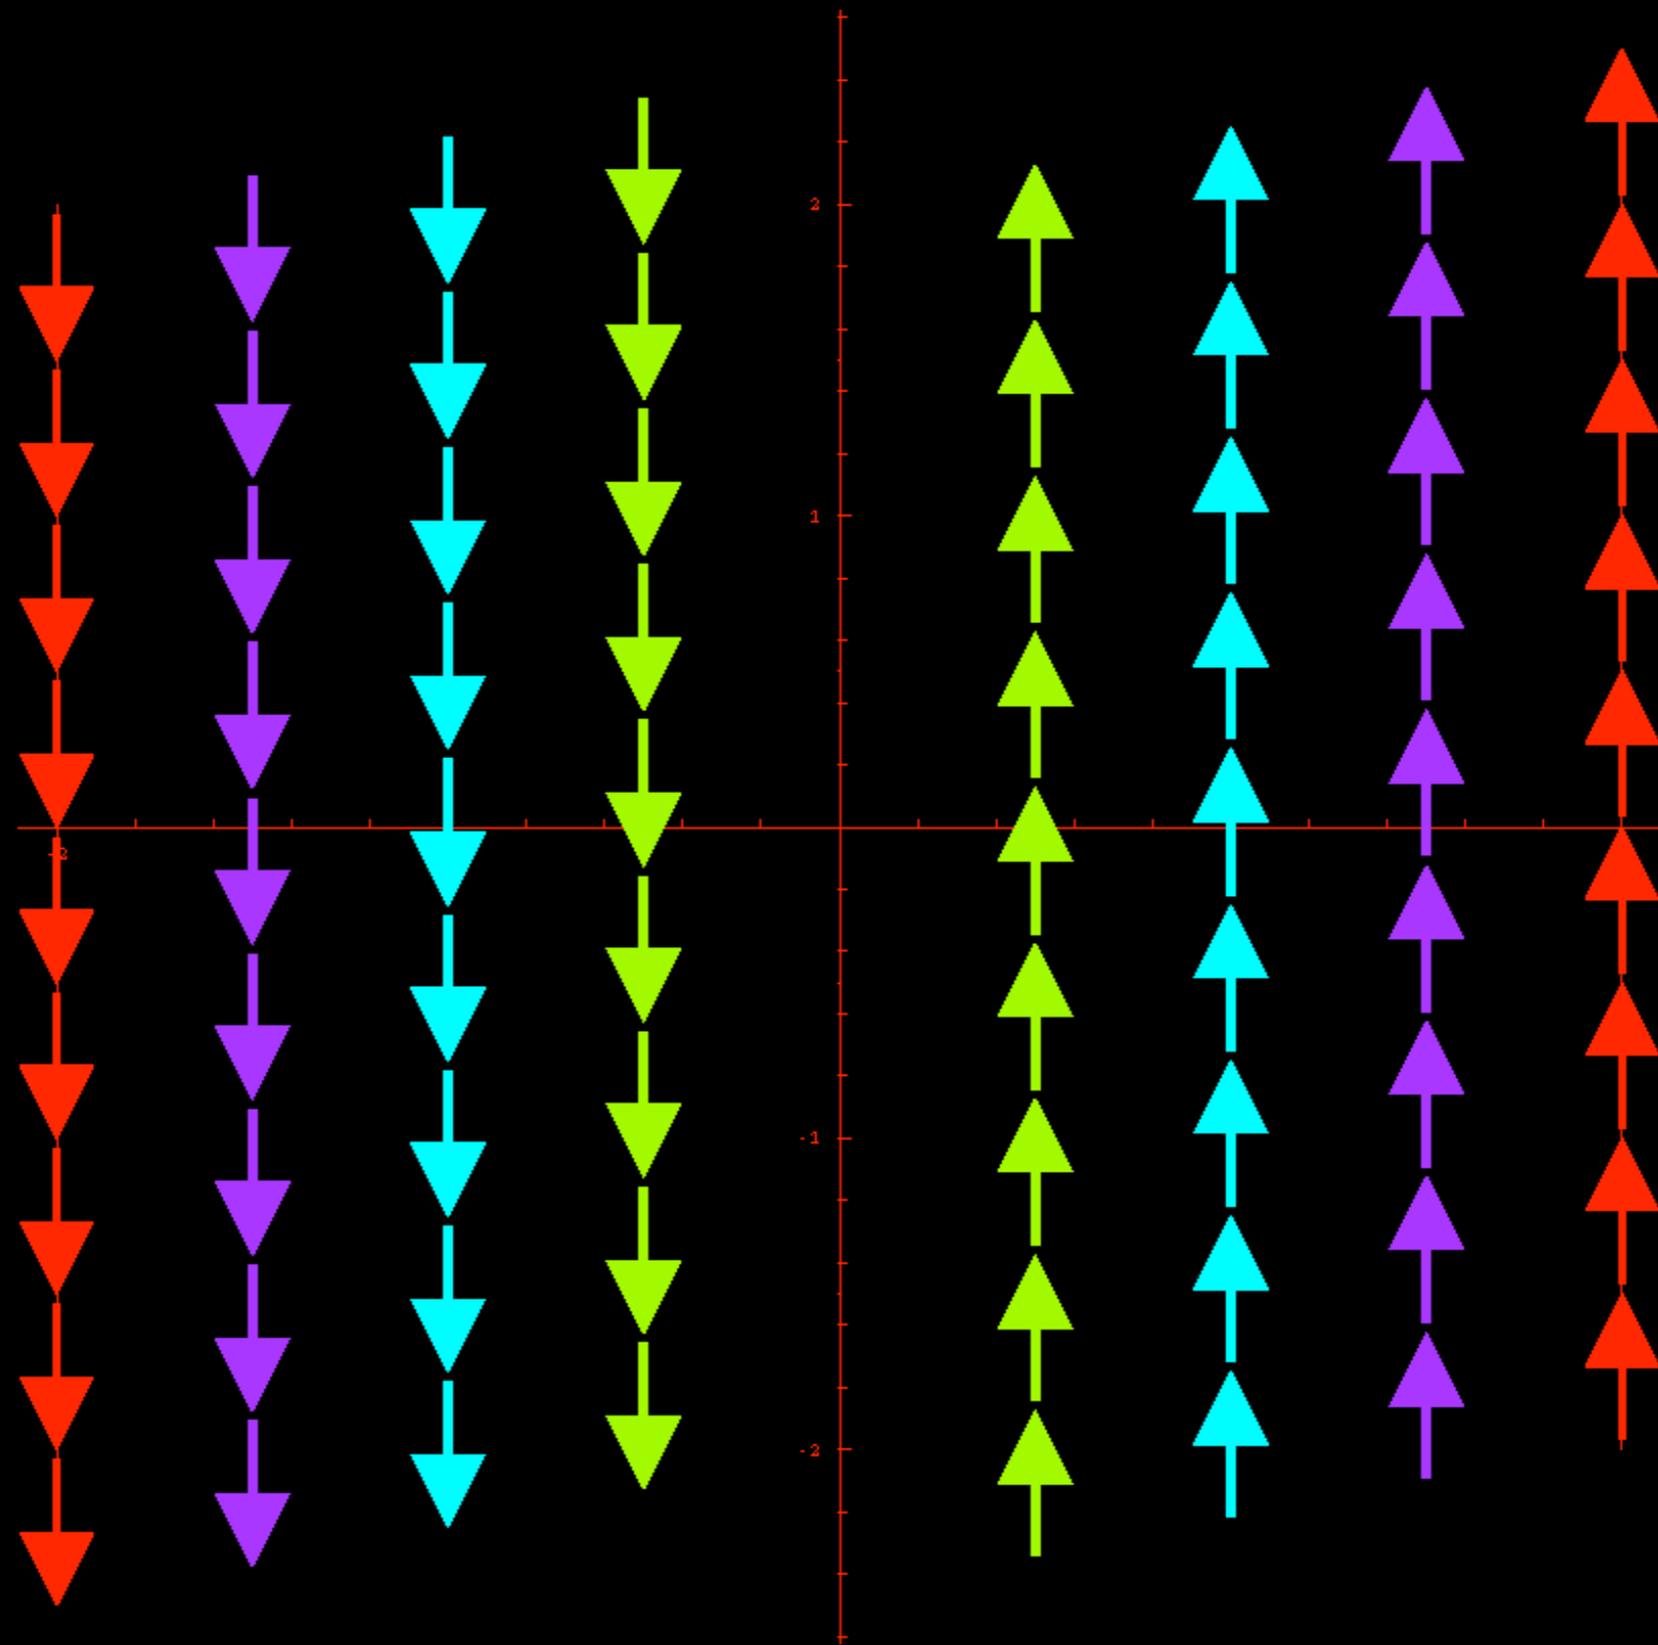

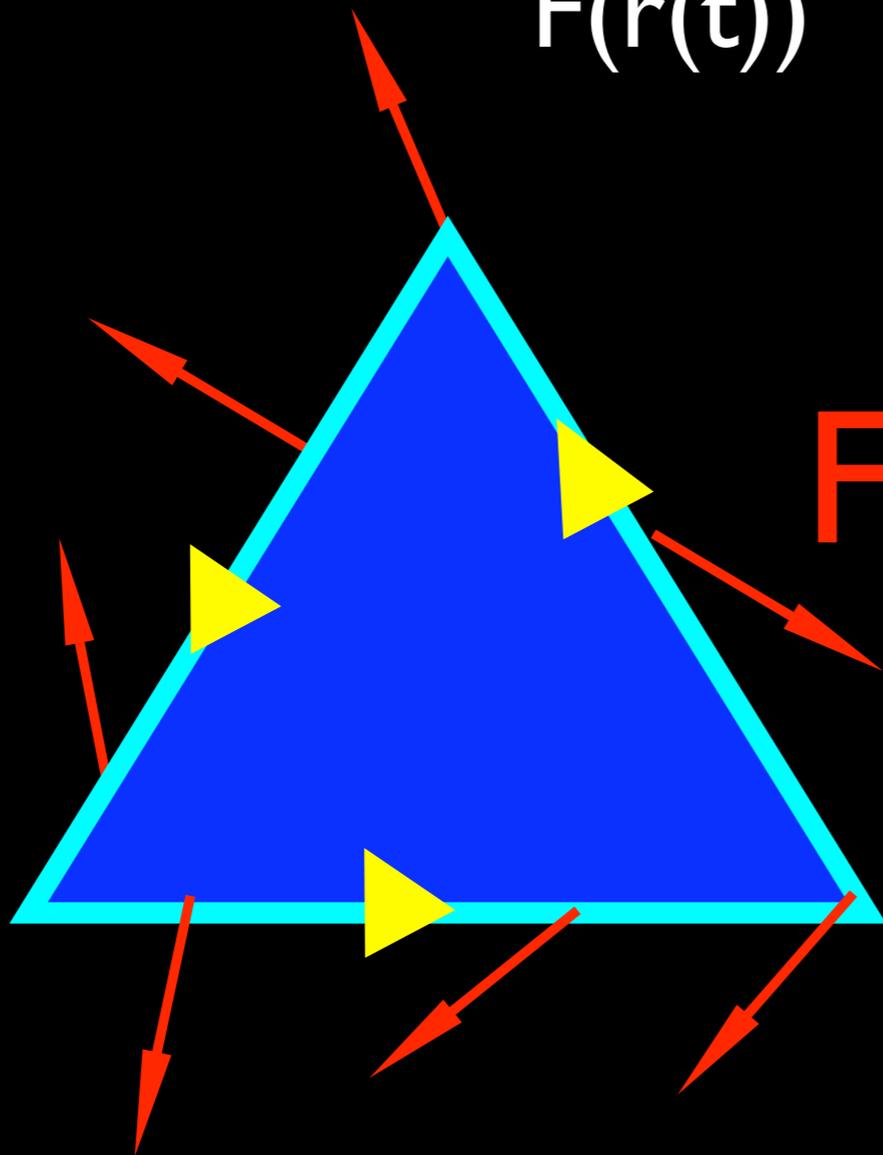

Line integrals

$F(r(t))$ “Force at point $r(t)$ ”

$$F(r(t)) \cdot r'(t)$$

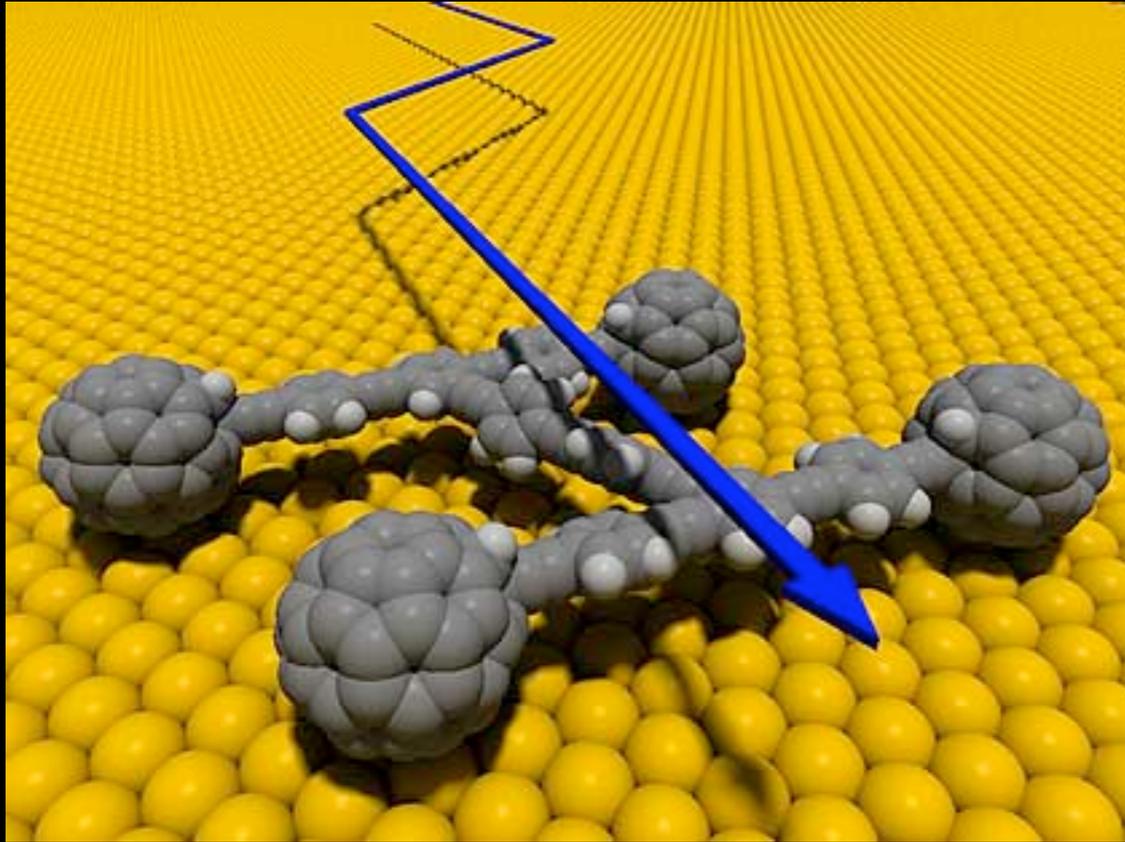

= “Power”

Integrating this
over the time
interval gives an
energy.

Is this line integral positive or negative?

Nano car problem

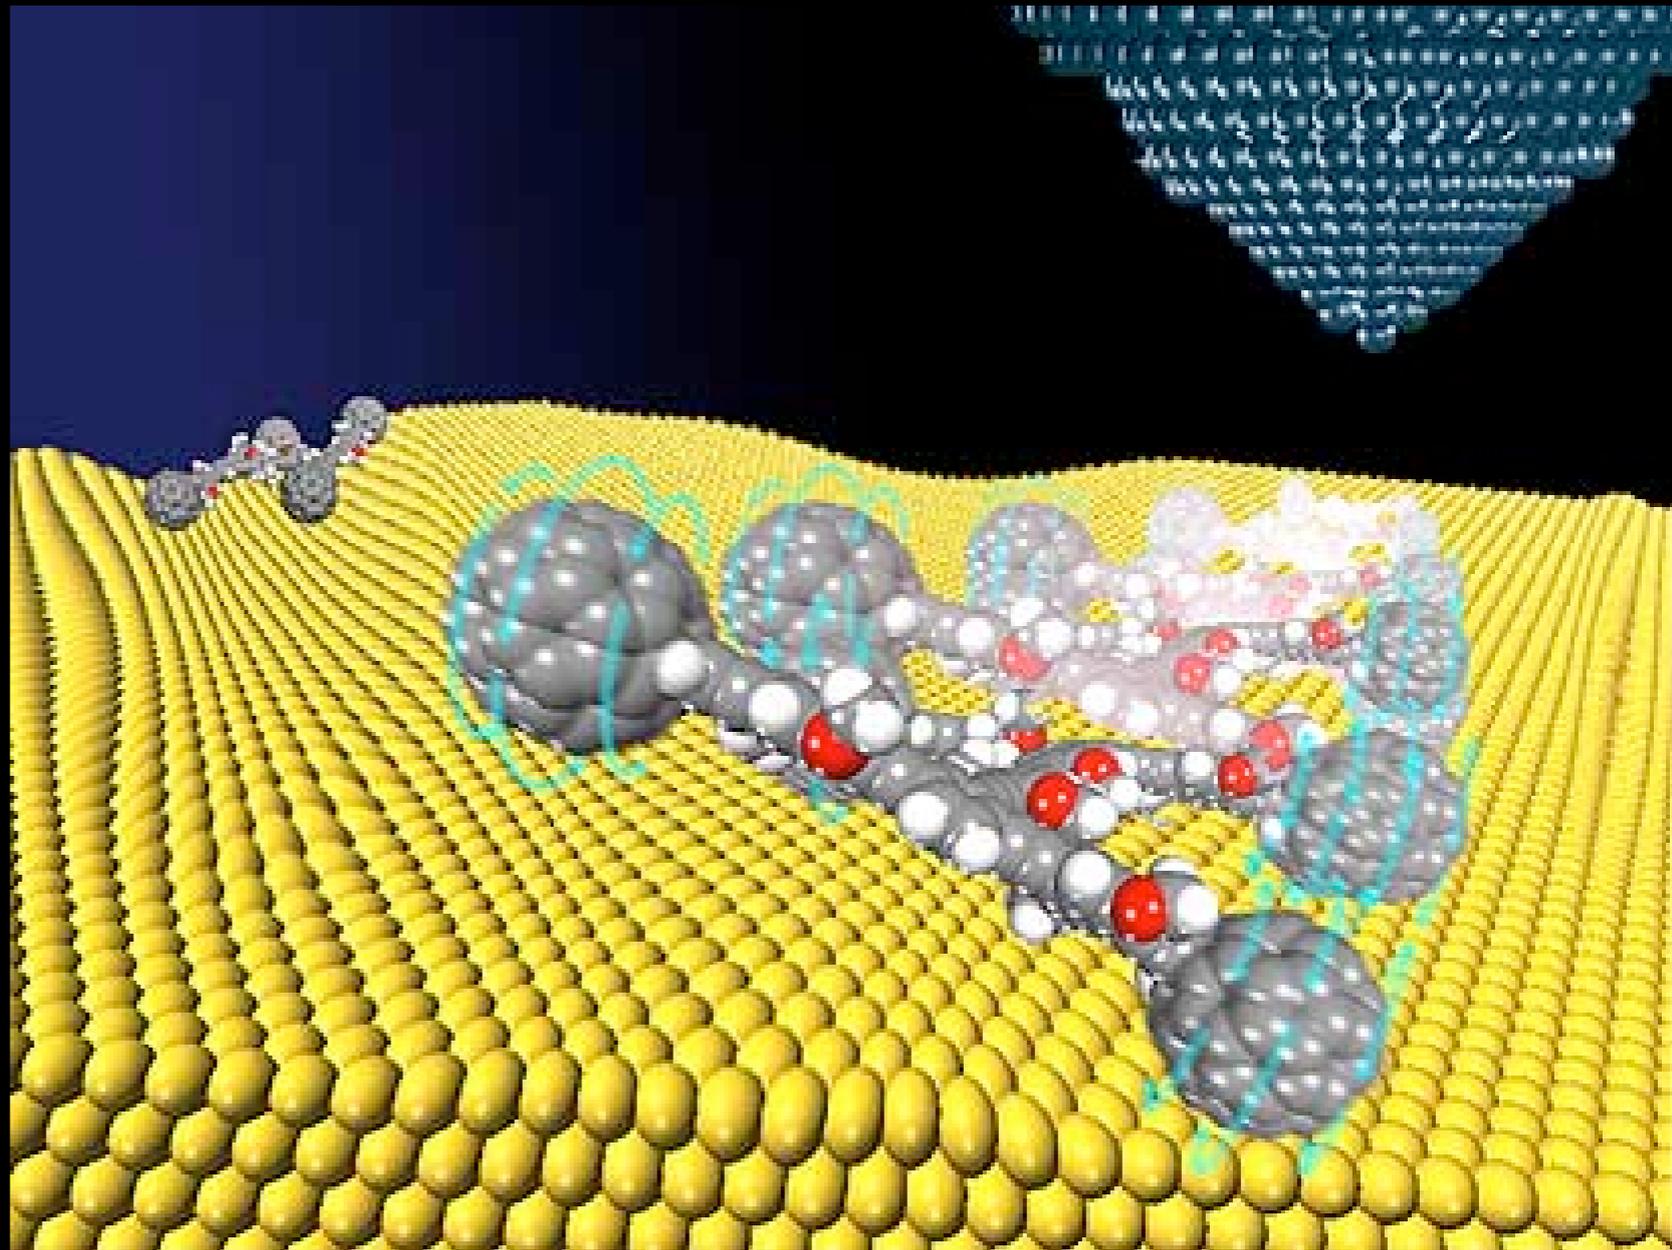

At Rice university, one has build the first nanocar, it is 20'000 times smaller than the thickness of a hair and made of one molecule. The “street” is a gold plate which is heated up.

Nano car problem

The car is exposed to a force field

$$F(x,y,z) = (yz, x, z)$$

from the surface and pushed along a path $r(t) = (t, \cos(t), \sin(t))$, where t goes from 0 to π . What work is done on the car?

What do you think,
when you see this picture?

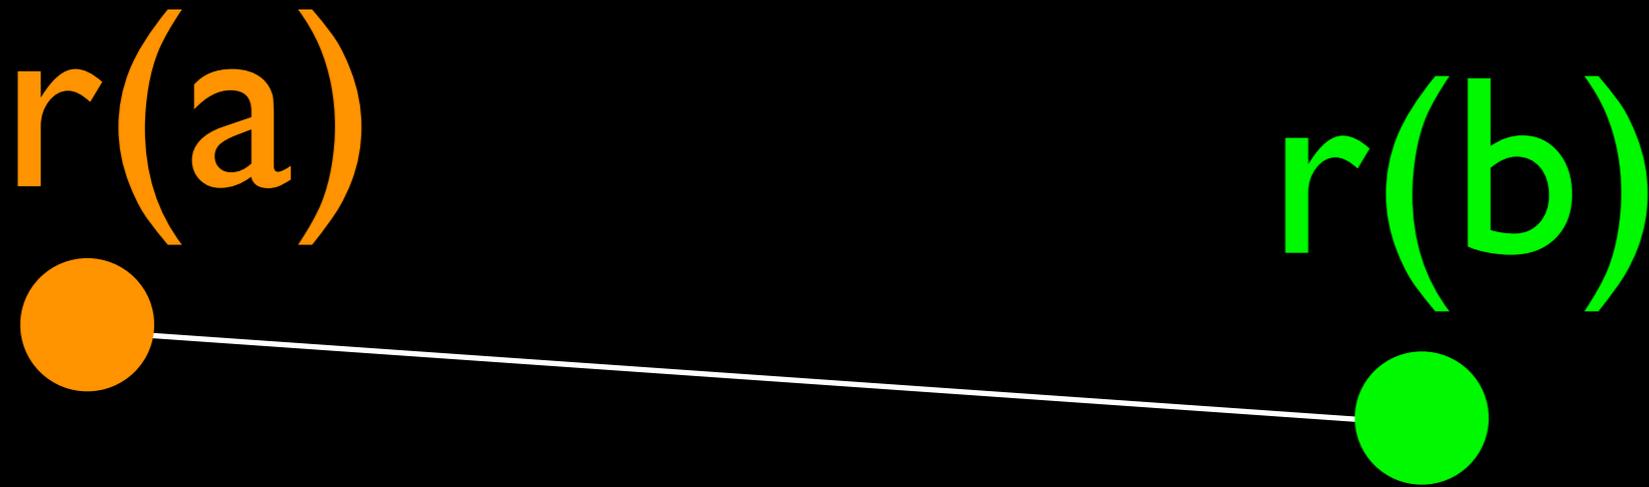

The Fundamental theorem of Lineintegrals of course!

$f(r(a))$

$f(r(b))$

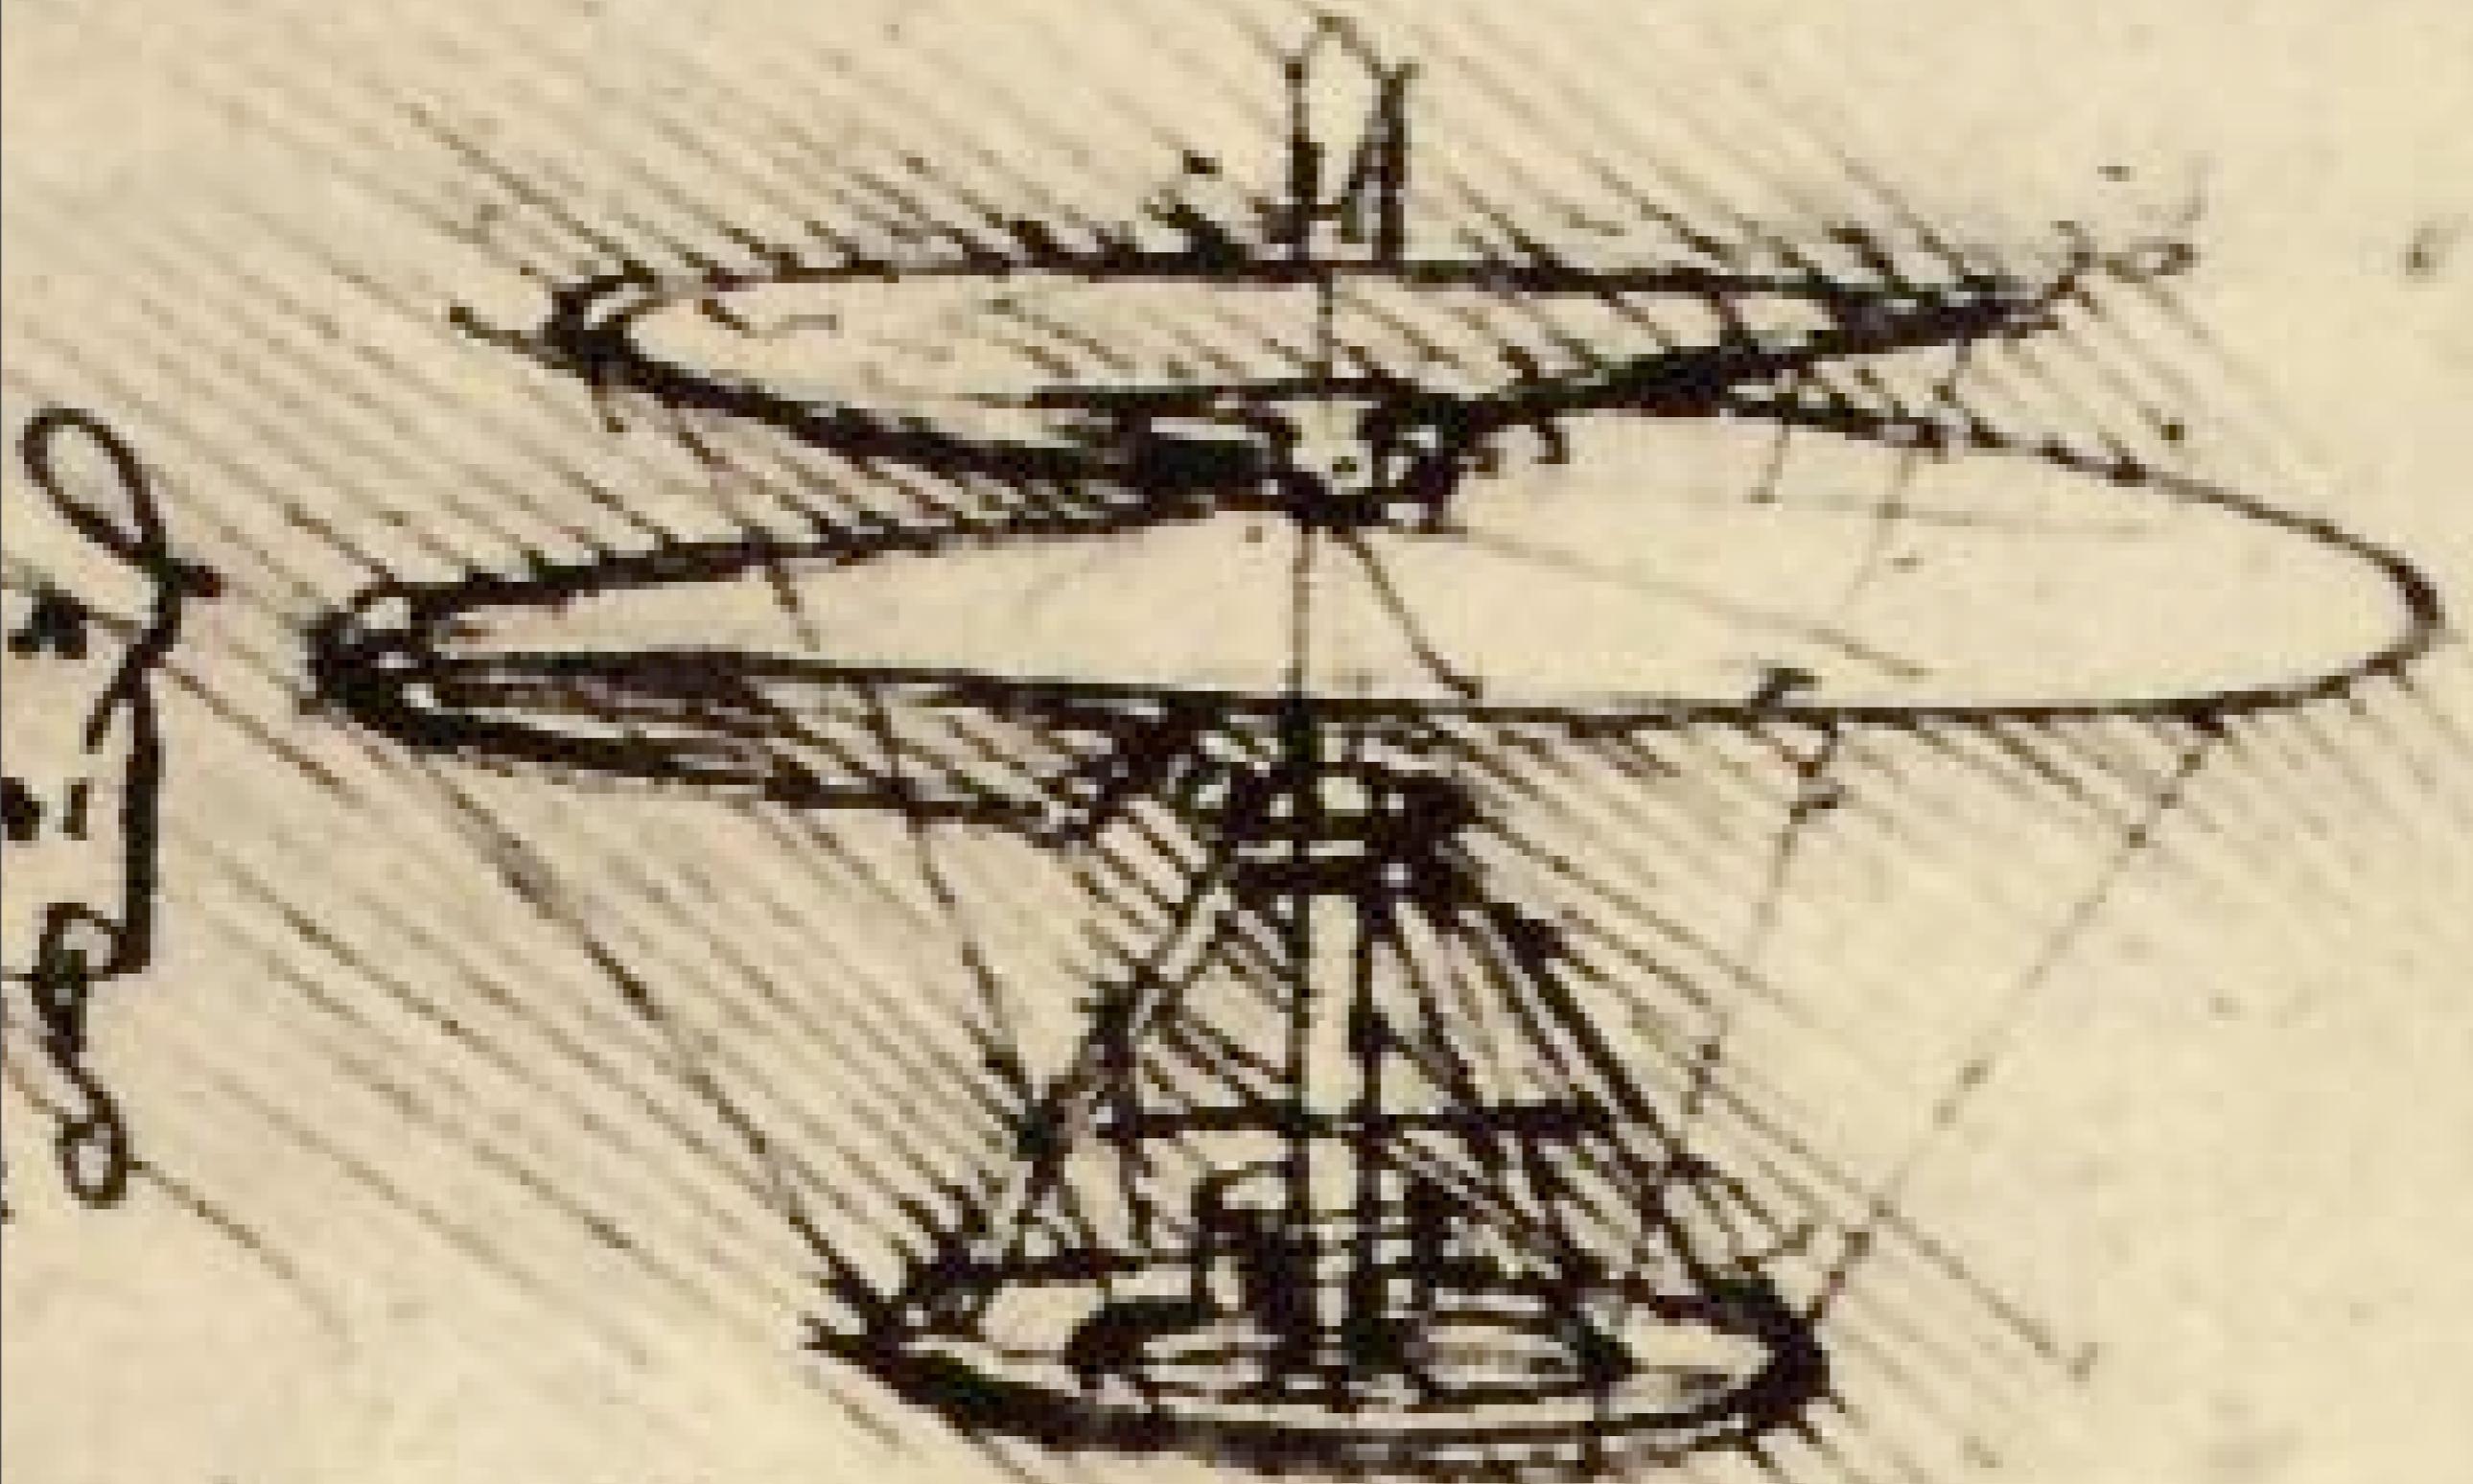

$$\int_{\gamma} \nabla f \cdot dr = f(r(b)) - f(r(a))$$

Fundamental theorem of Lineintegrals

$$\int_{\gamma} \nabla f \cdot dr = f(r(b)) - f(r(a))$$

**500 years ago, helicopters
were a dream**

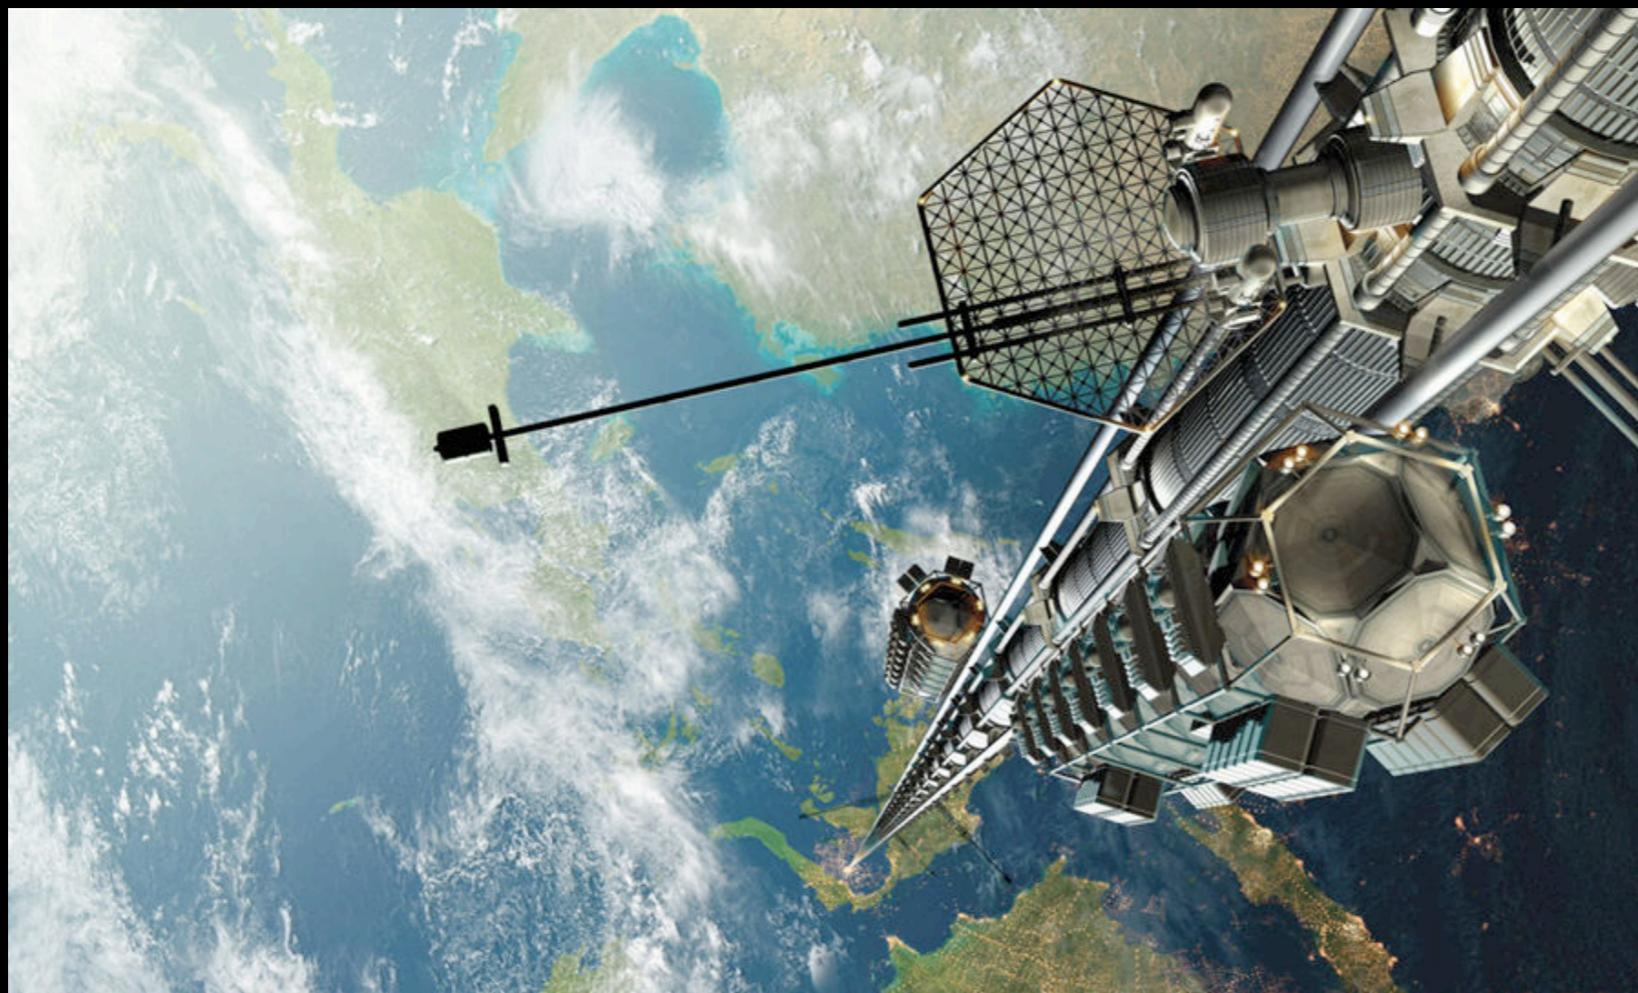

Today, space elevators are.

Problem: We are in the year 2094. Many space elevators have been built. The gravitational field of the earth is $(-x, -y, -z)/(x^2 + y^2 + z^2)^{3/2}$.

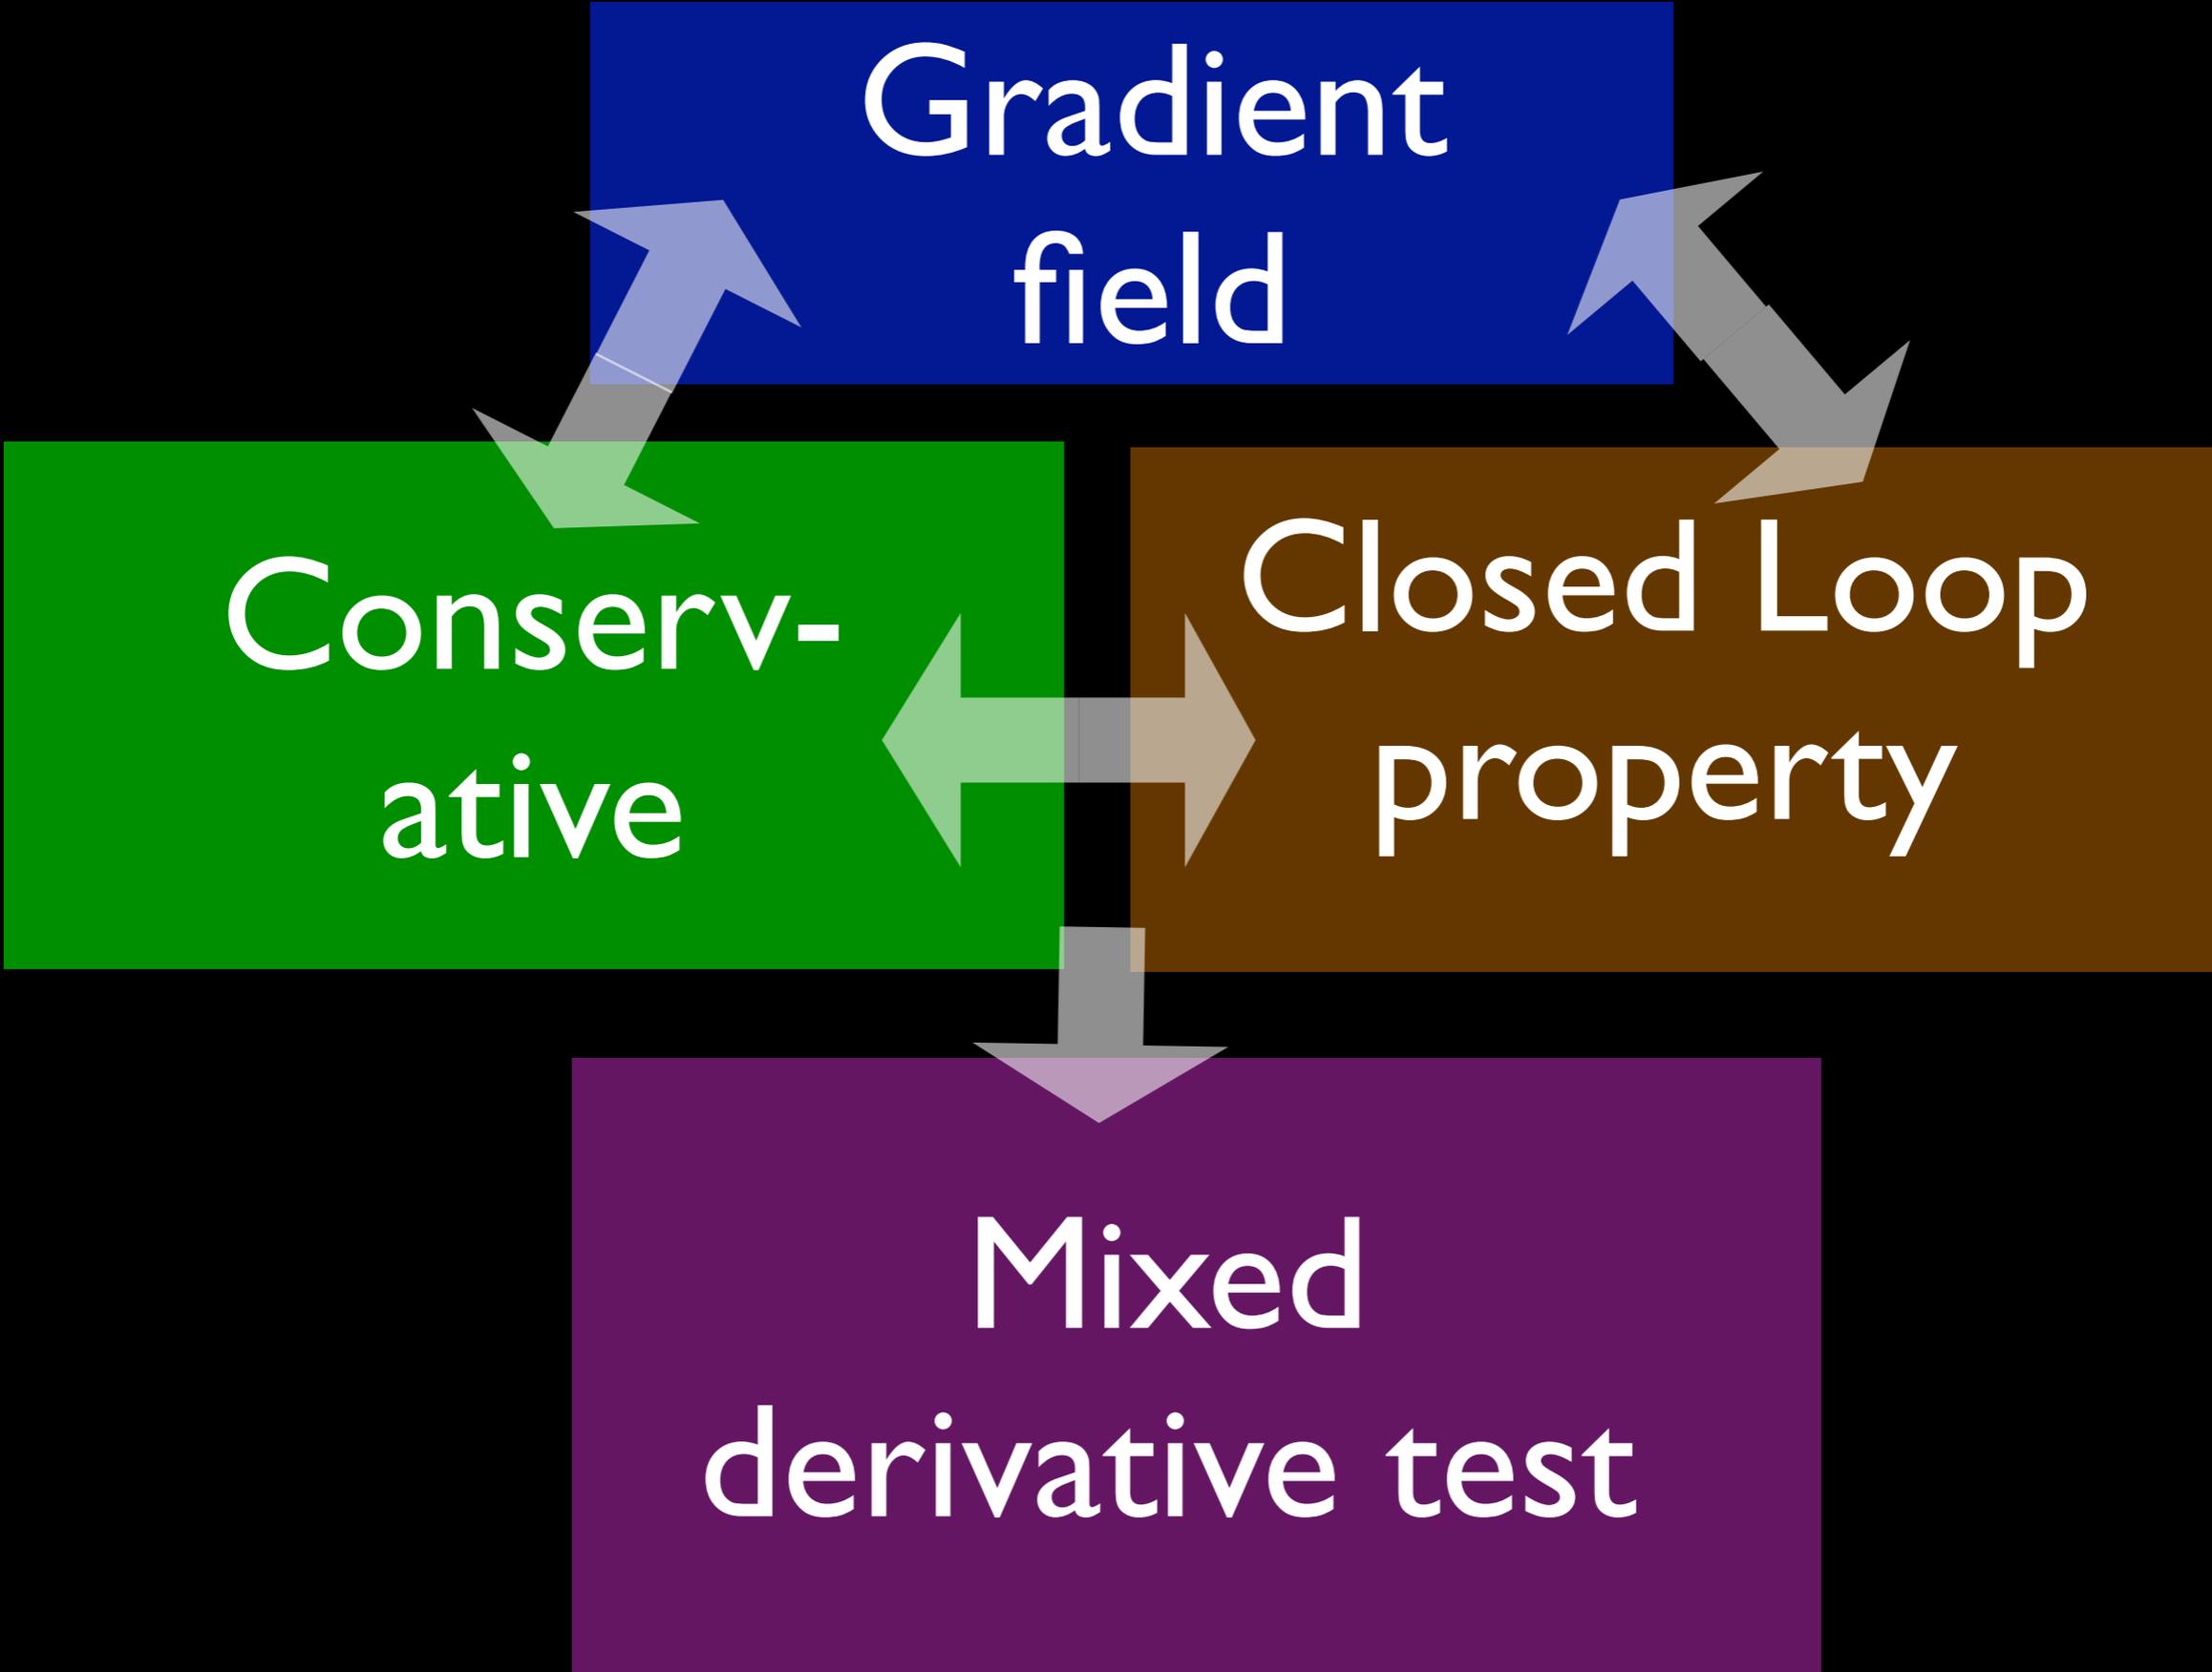

What work is necessary to go from the earth ground $(0,0,6)$ to the point $(0,0,66)$?

(units are
1000 km)

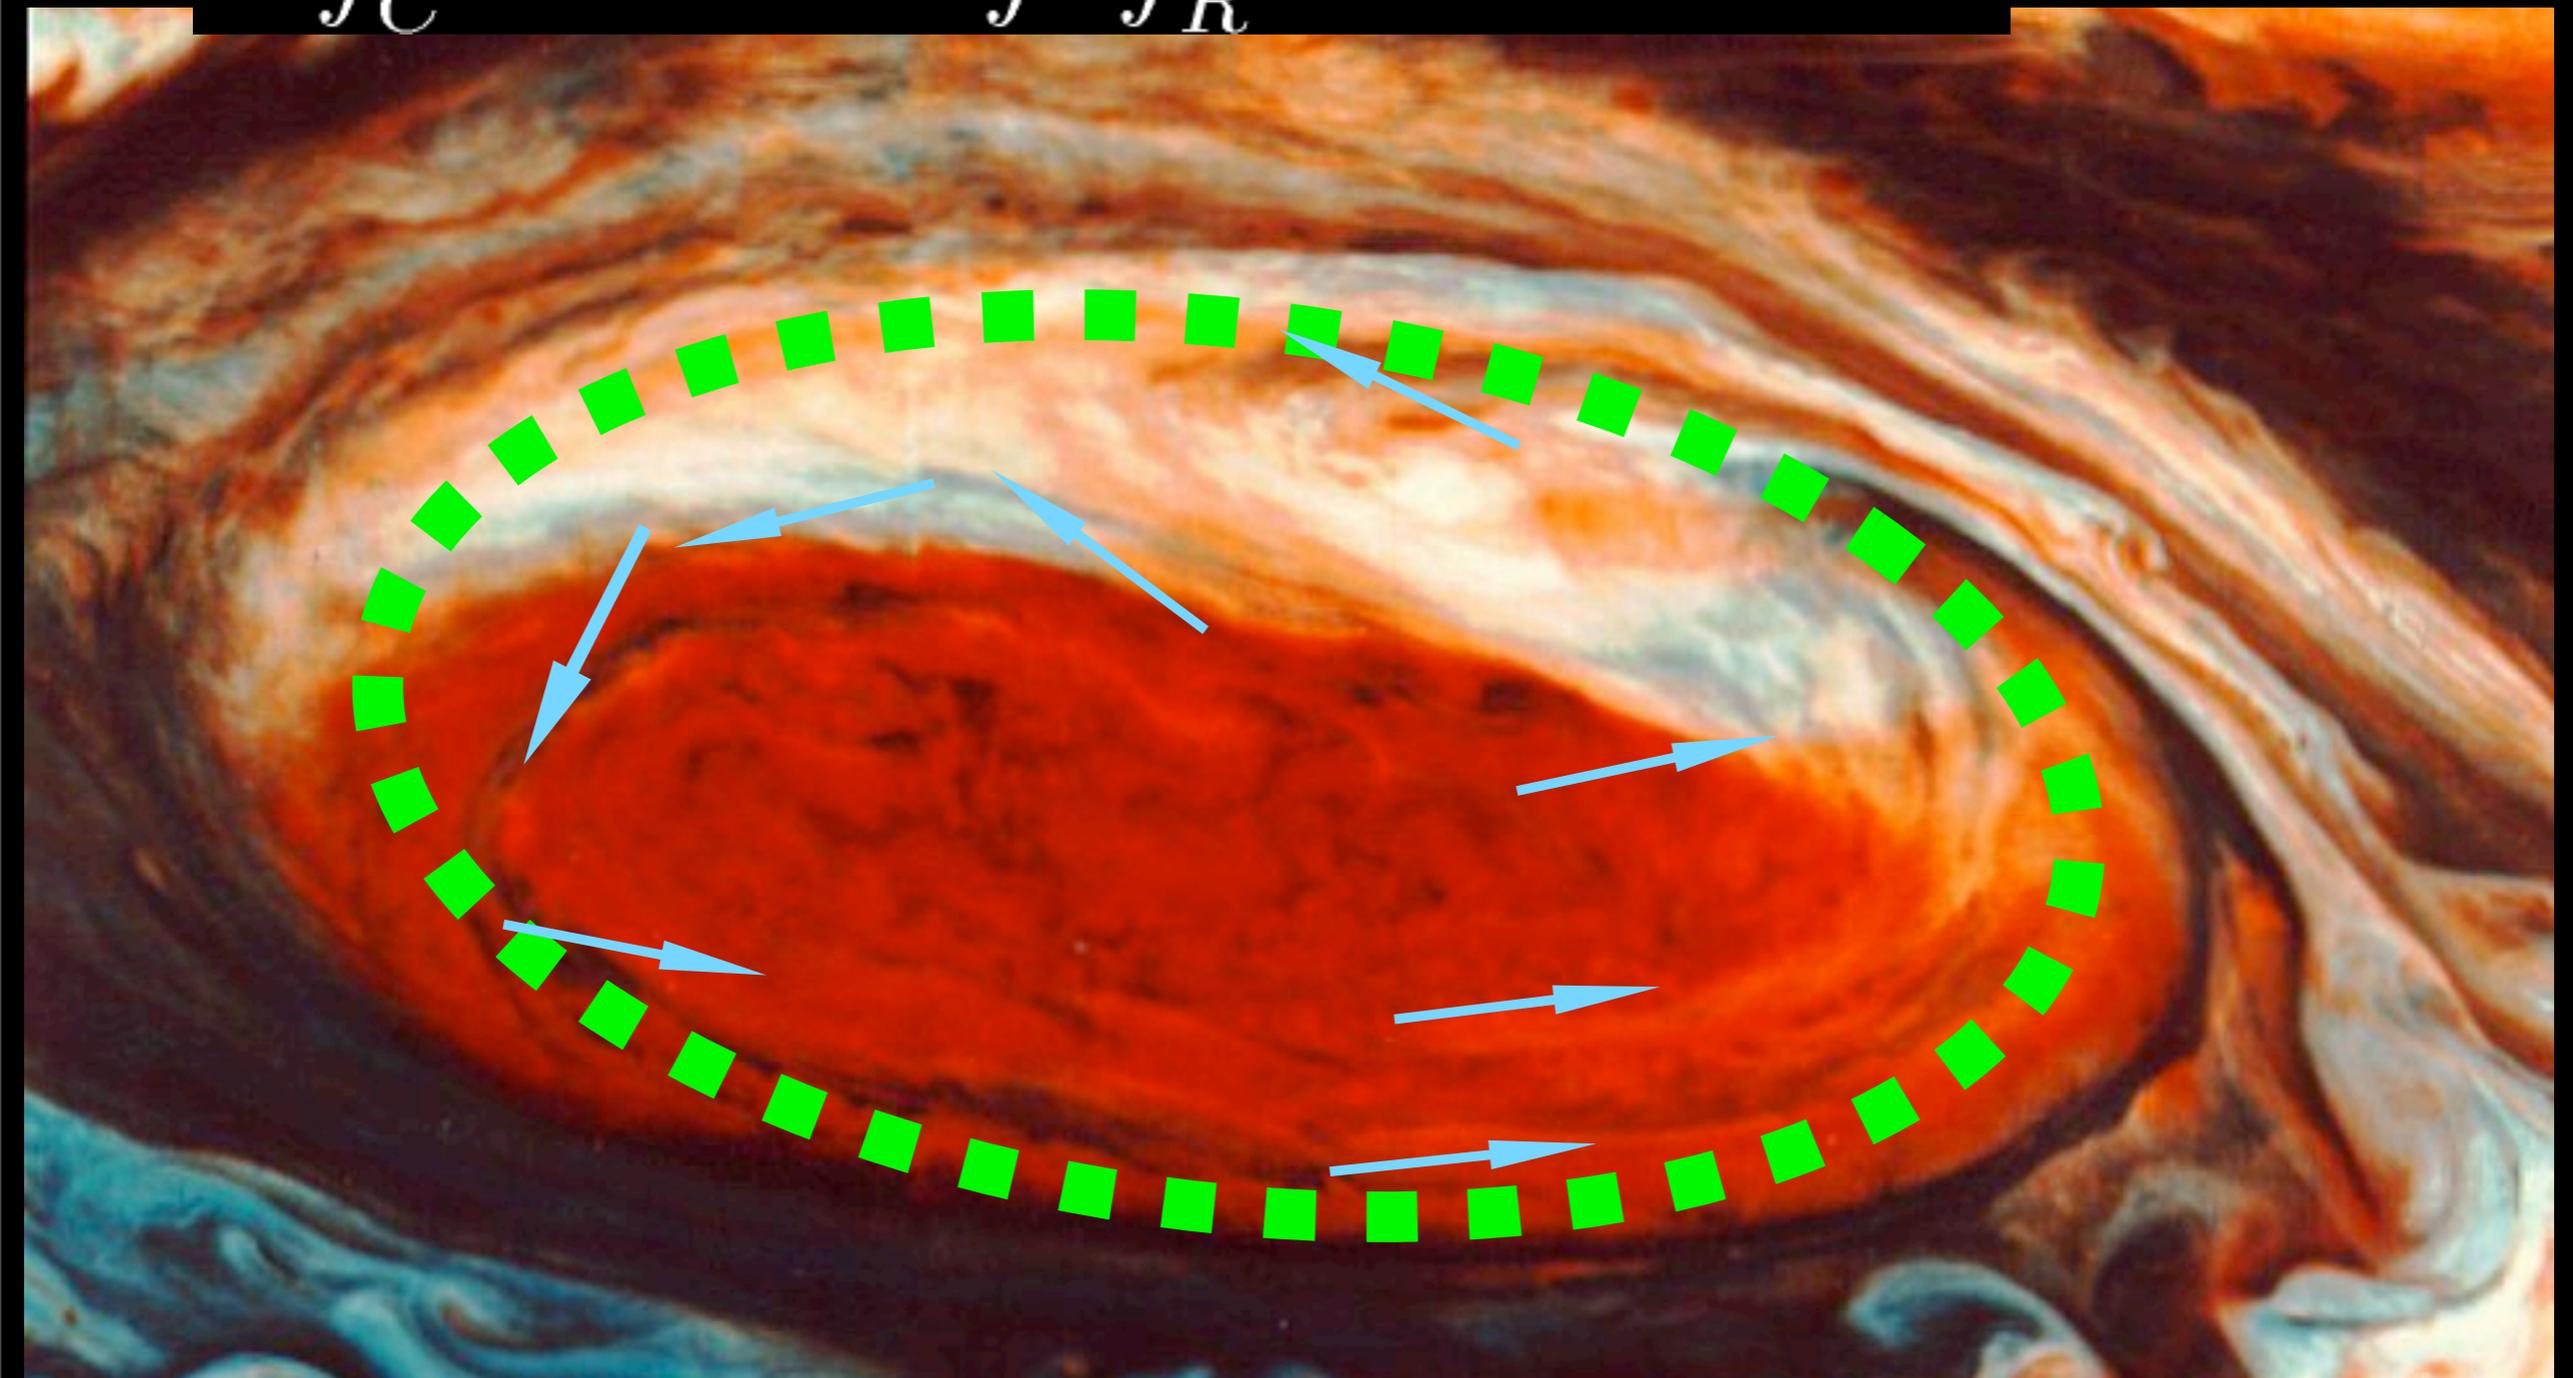

Instead of computing the line integral, it is better to realize that F has a potential and taking the potential difference.

The potential is $1/\sqrt{x^2 + y^2 + z^2}$

Greens Theorem

$$\int_C F \cdot dr = \iint_R \text{curl}(F) \, dx \, dy$$

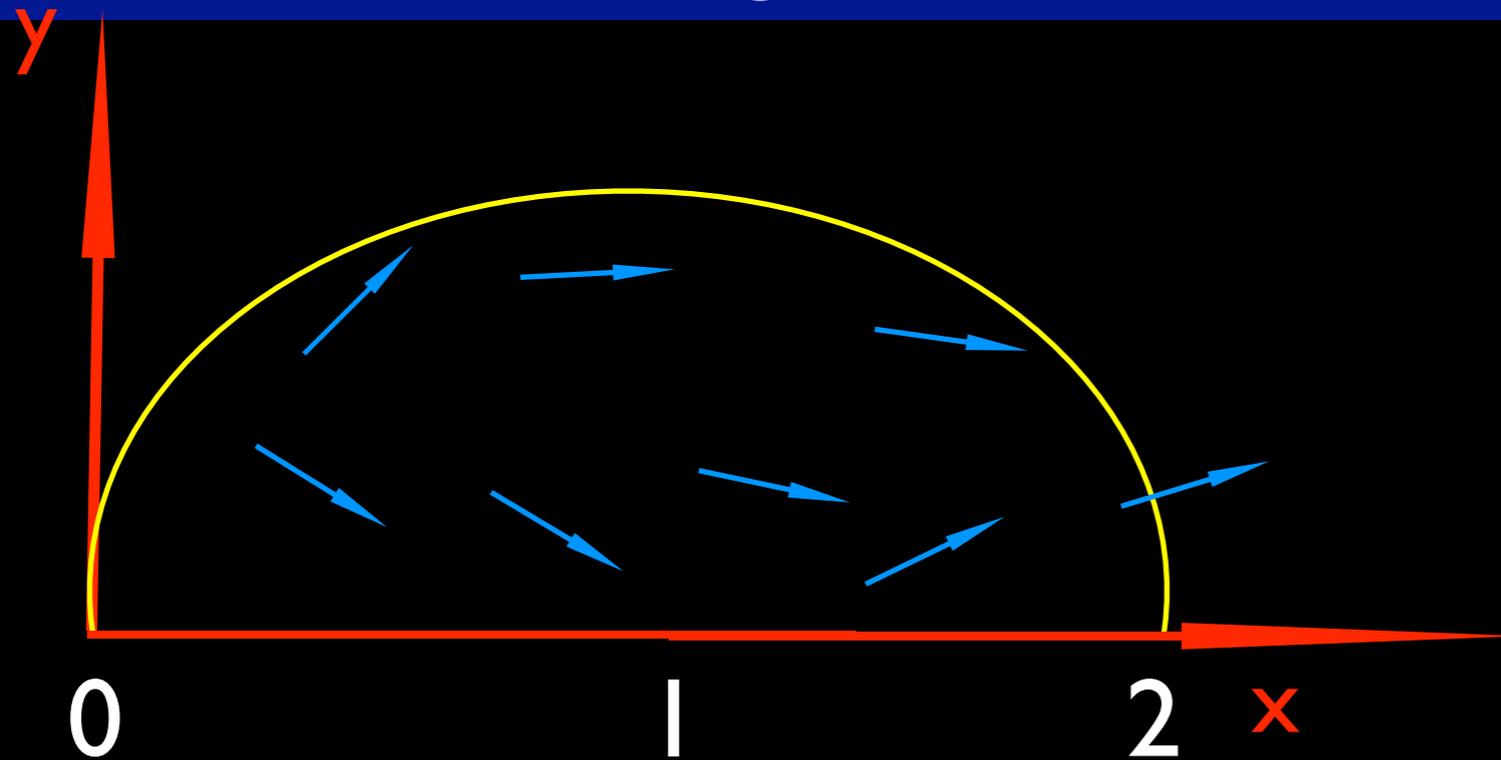

$$F(x, y) = (P, Q), \text{ curl}(F) = Q_x - P_y.$$

A line integral problem

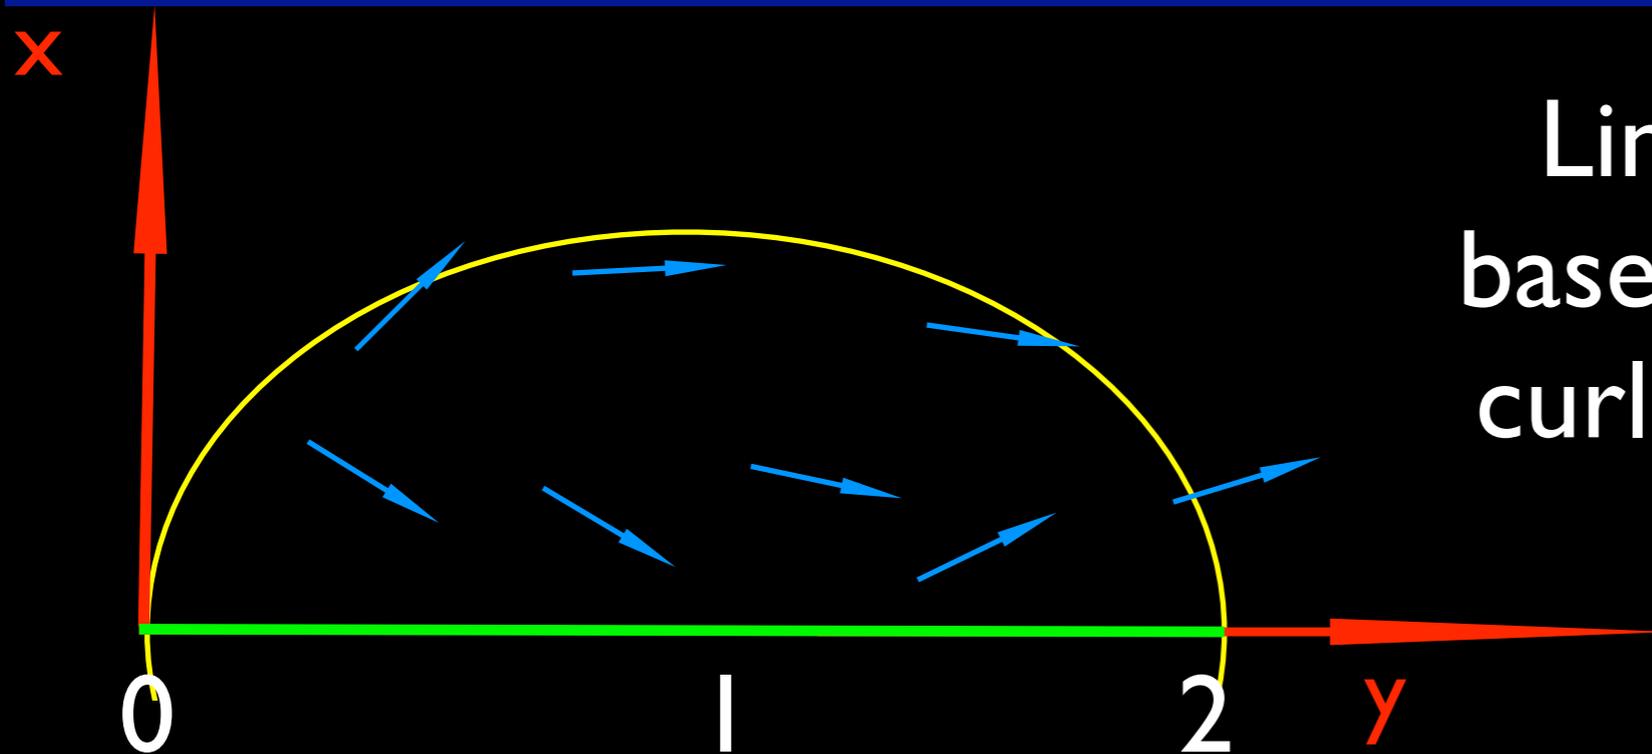

Problem

Find the line integral of the vector field
 $F(x,y) = (y^2 \cos(x) + 3, x + 2y \sin(x))$
along the upper semi circle (counterclockwise)
given below.

Use Green!

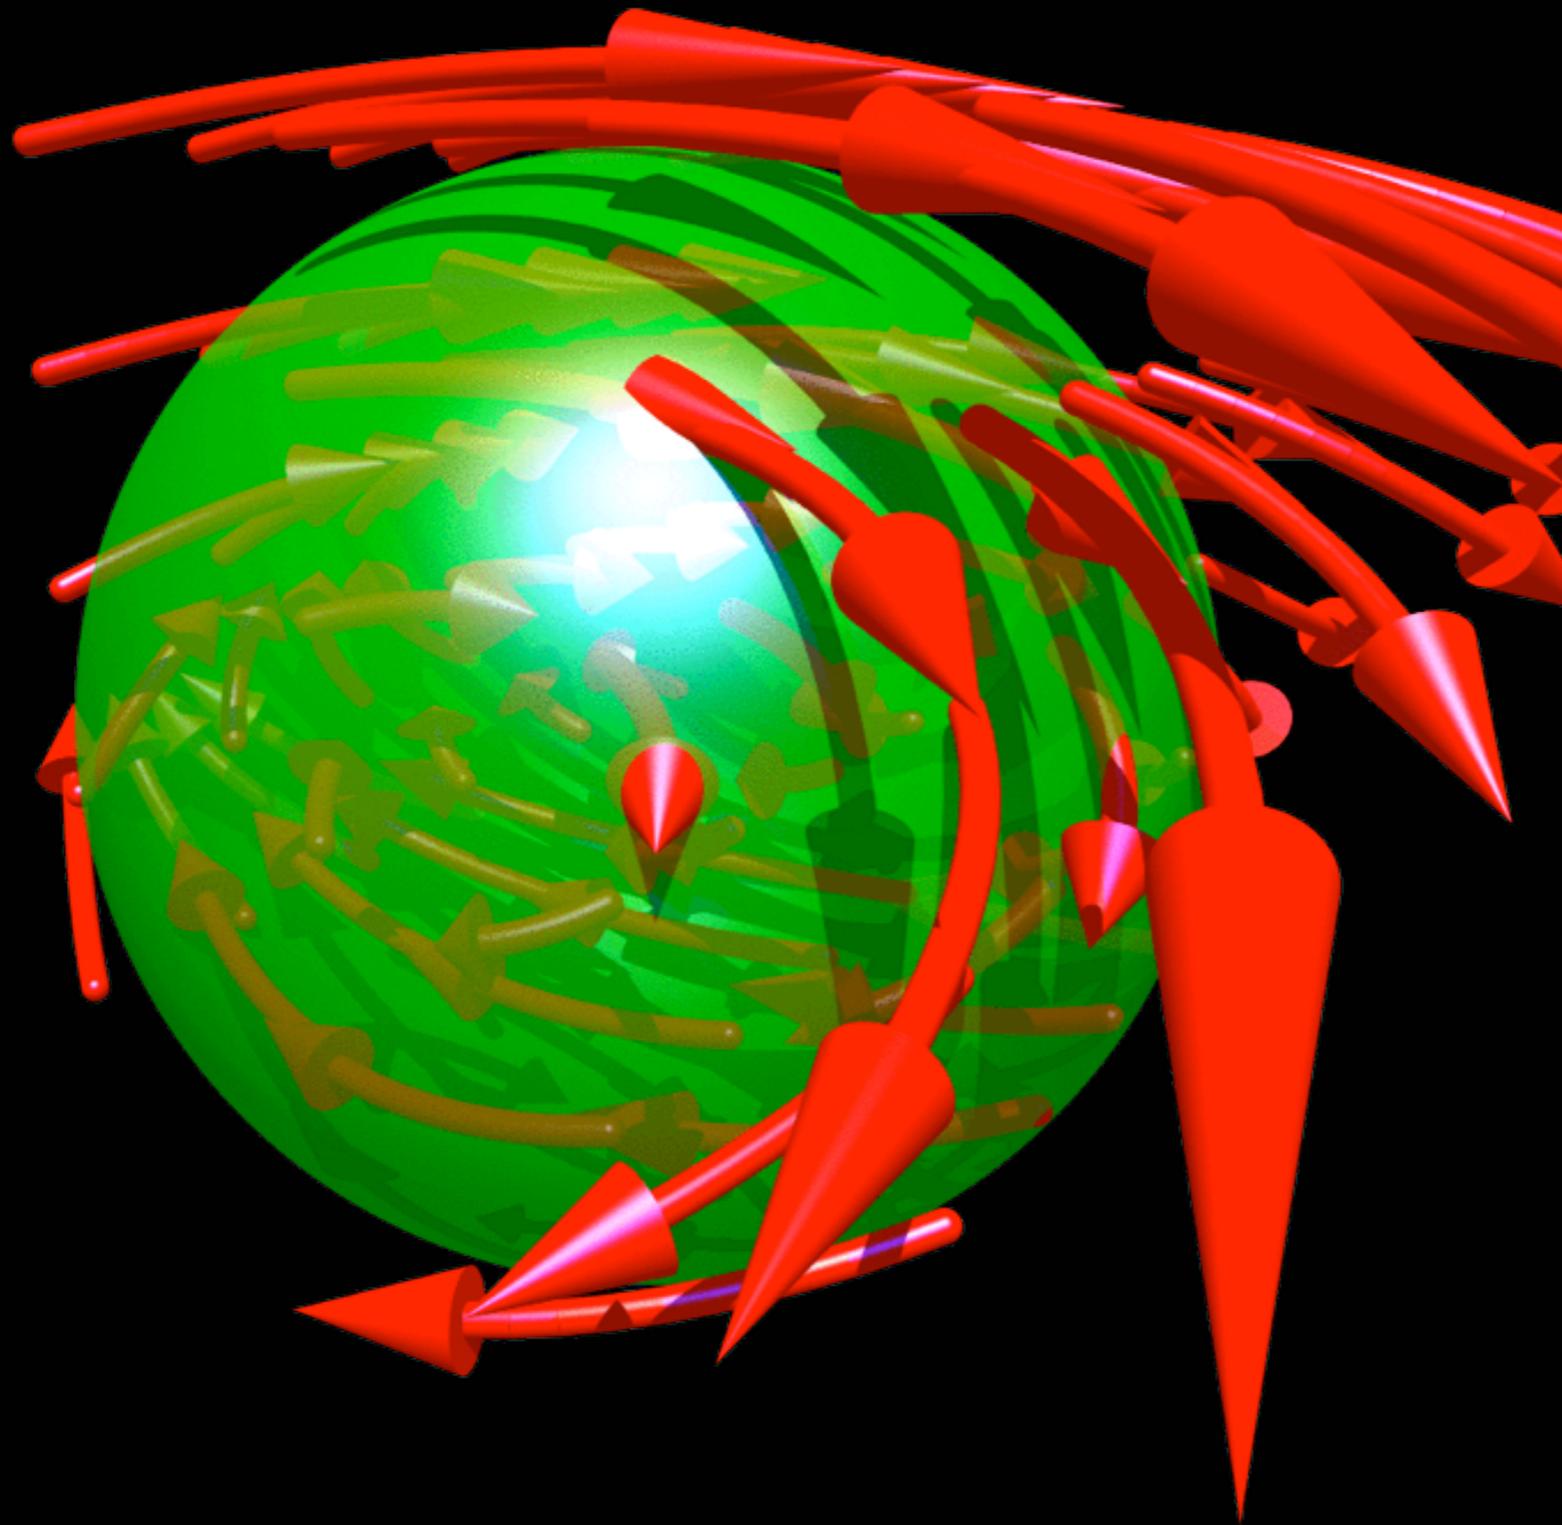

The vector field
 $F(x,y) = (y^2 \cos(x) + 3, x + 2y \sin(x))$
has $\text{curl}(F) = 1$

Line integral along
base is 6. Integral of
 $\text{curl}(F)$ over region is
 $\pi/2$.

Answer: $X = \pi/2 - 6$

Flux

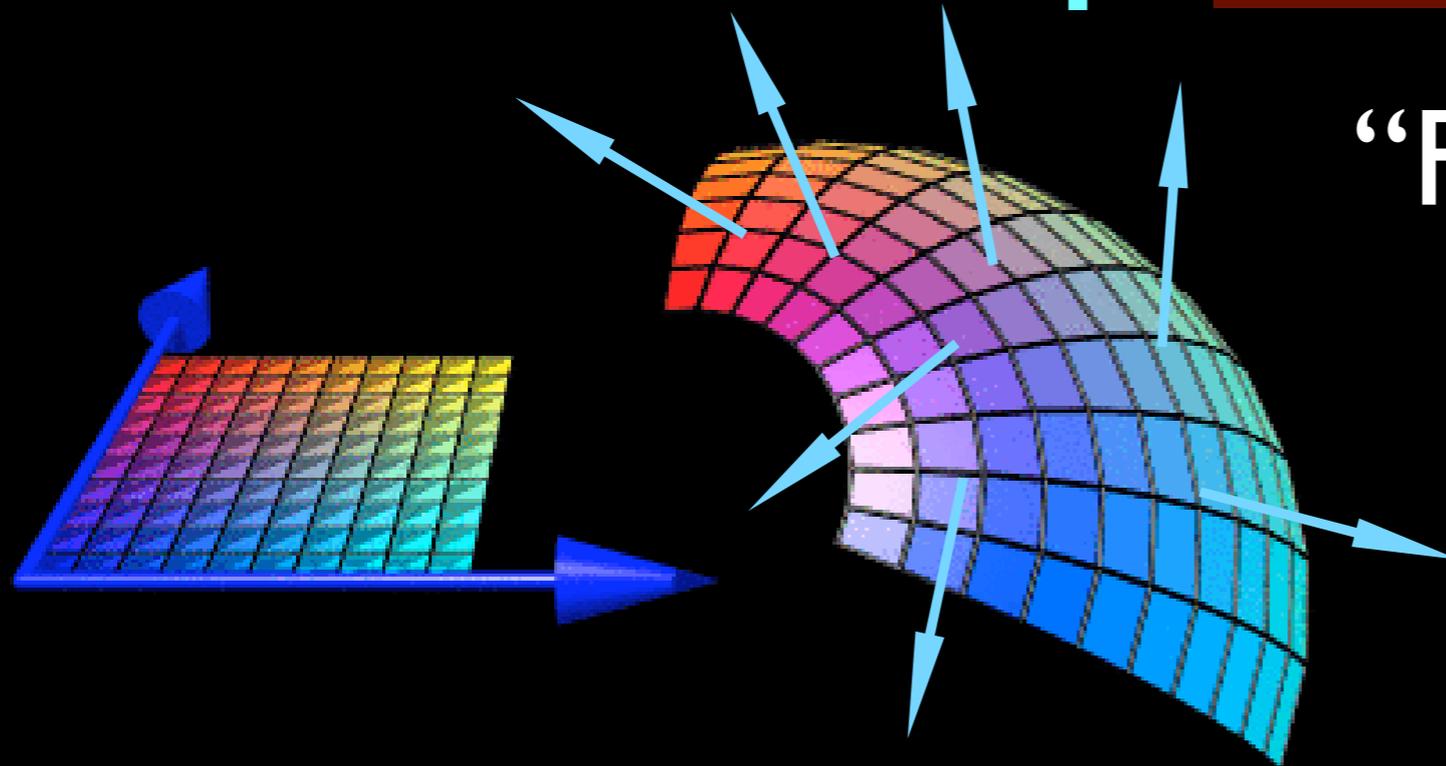

Flux integrals

$F(r(u,v))$ “Fluid velocity”

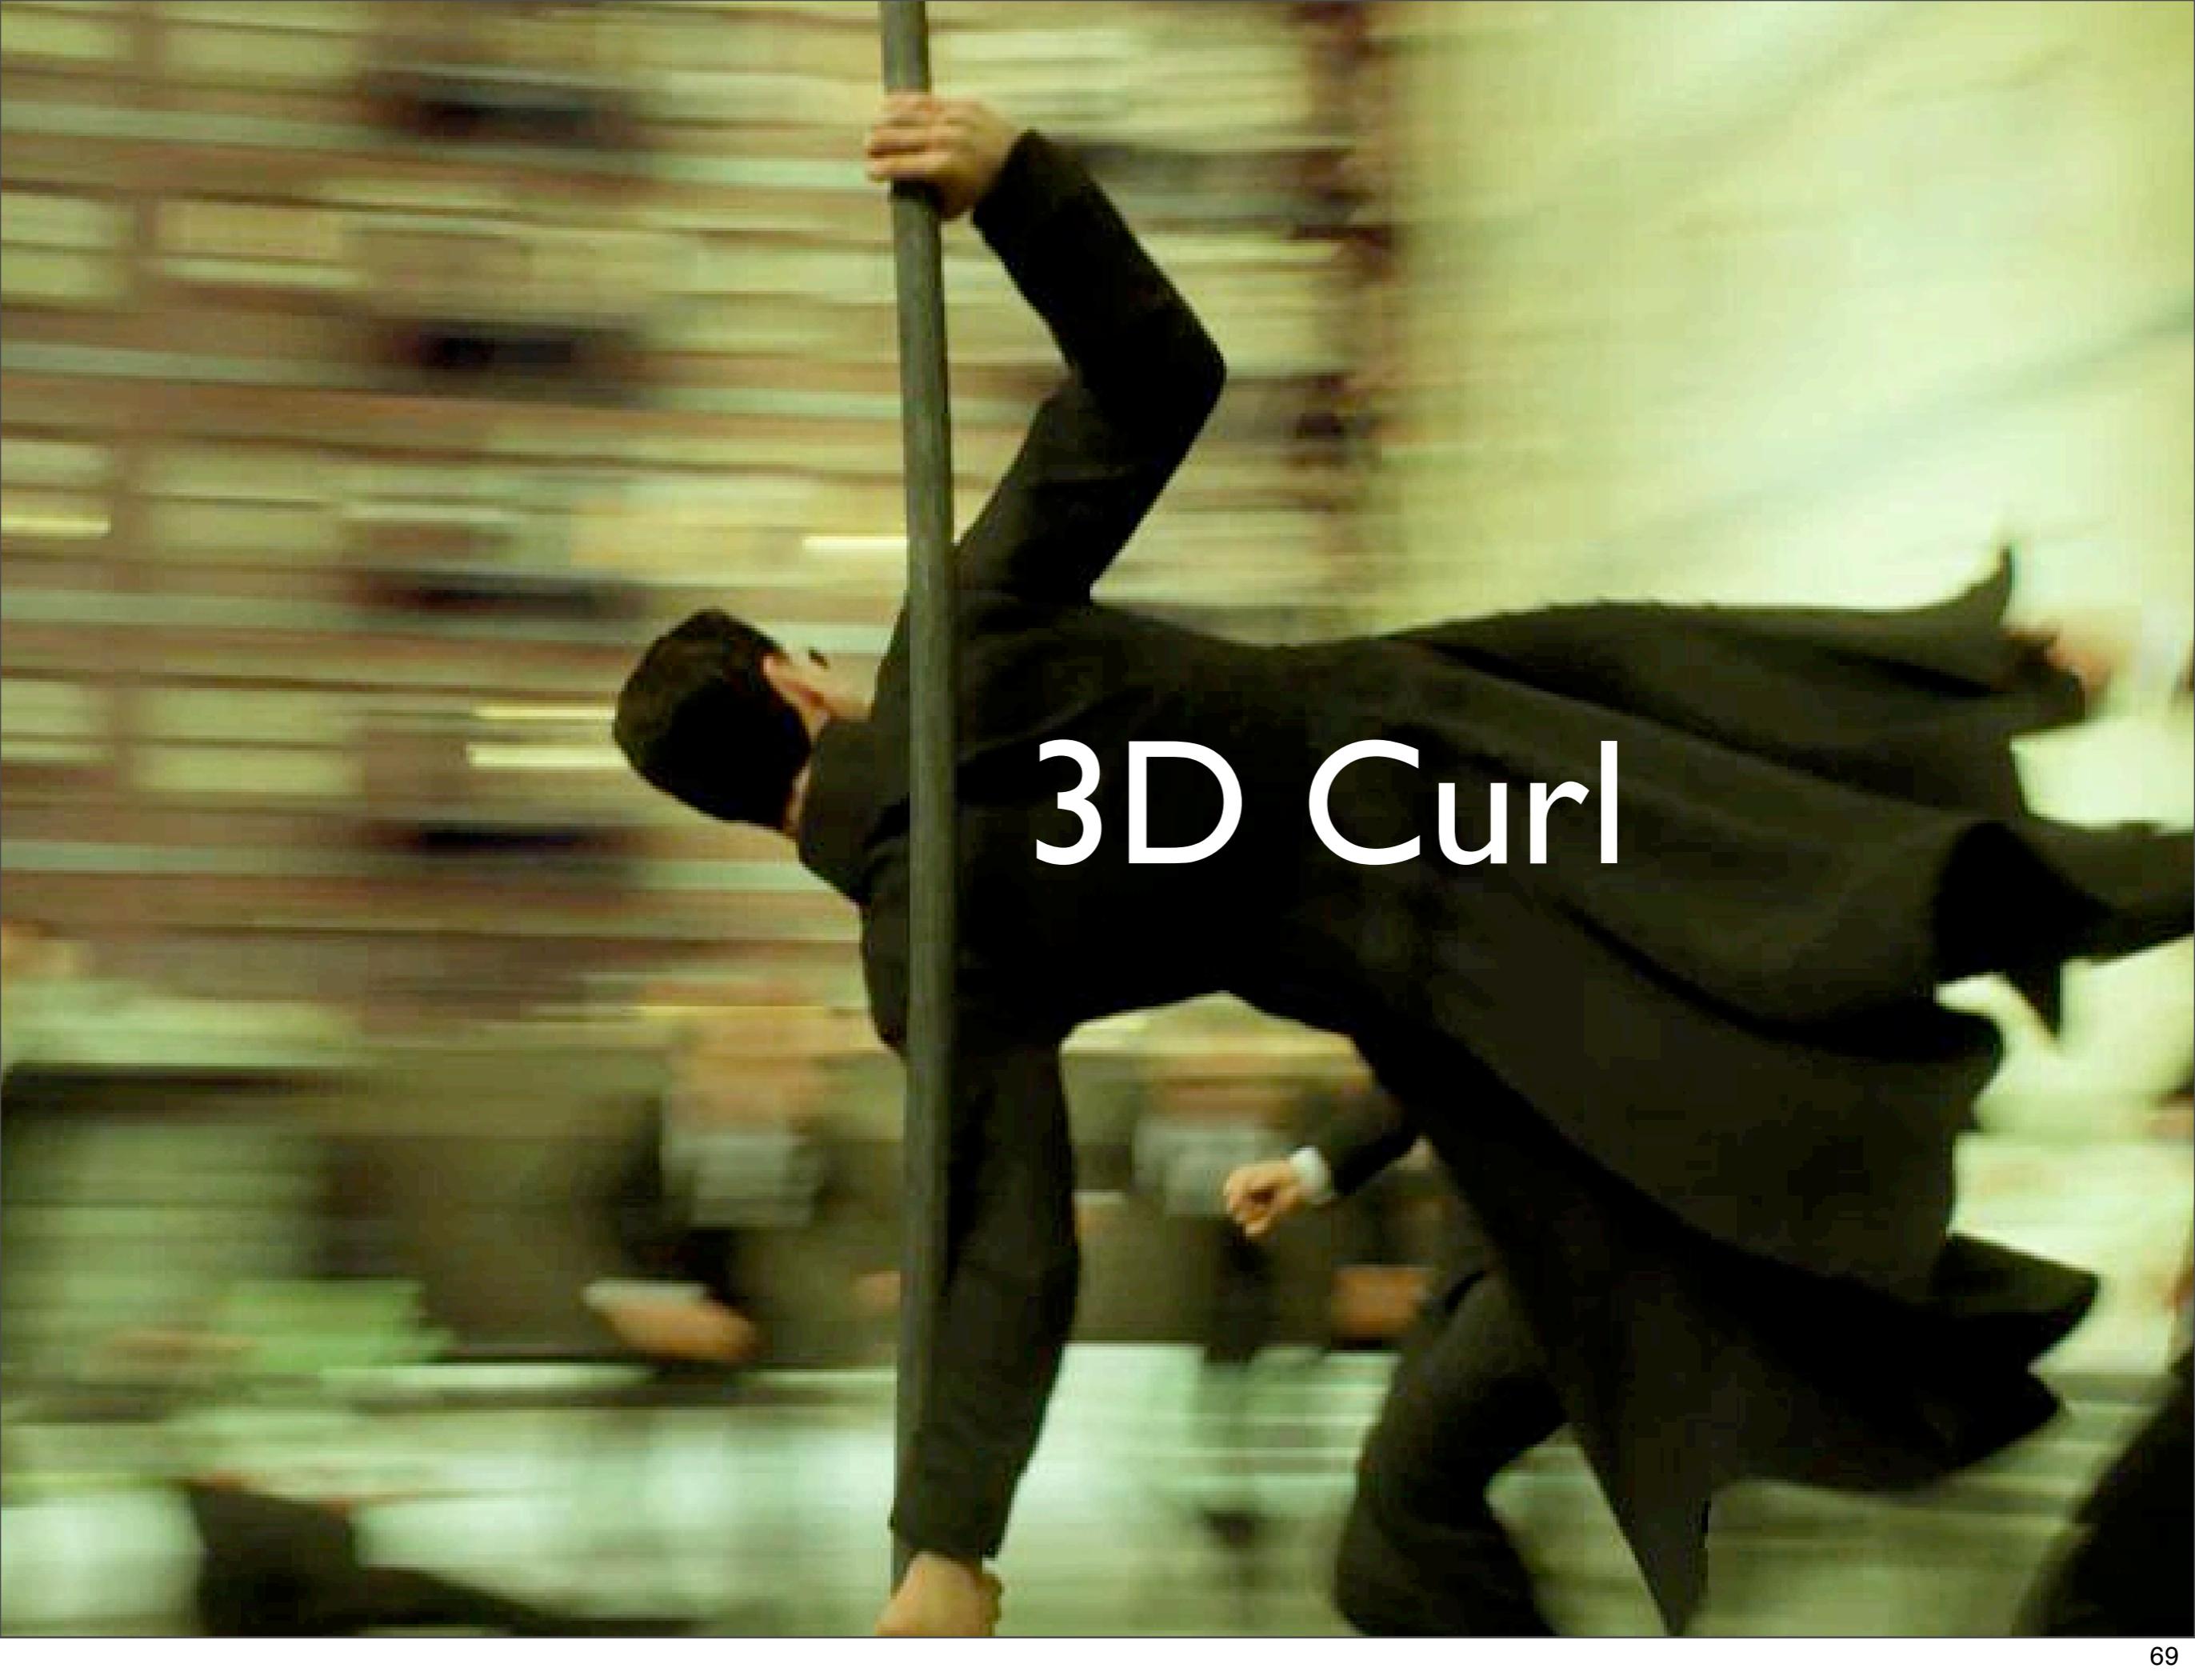

$$F(r(u,v)) \cdot r_u \times r_v =$$

F

“Flux component”

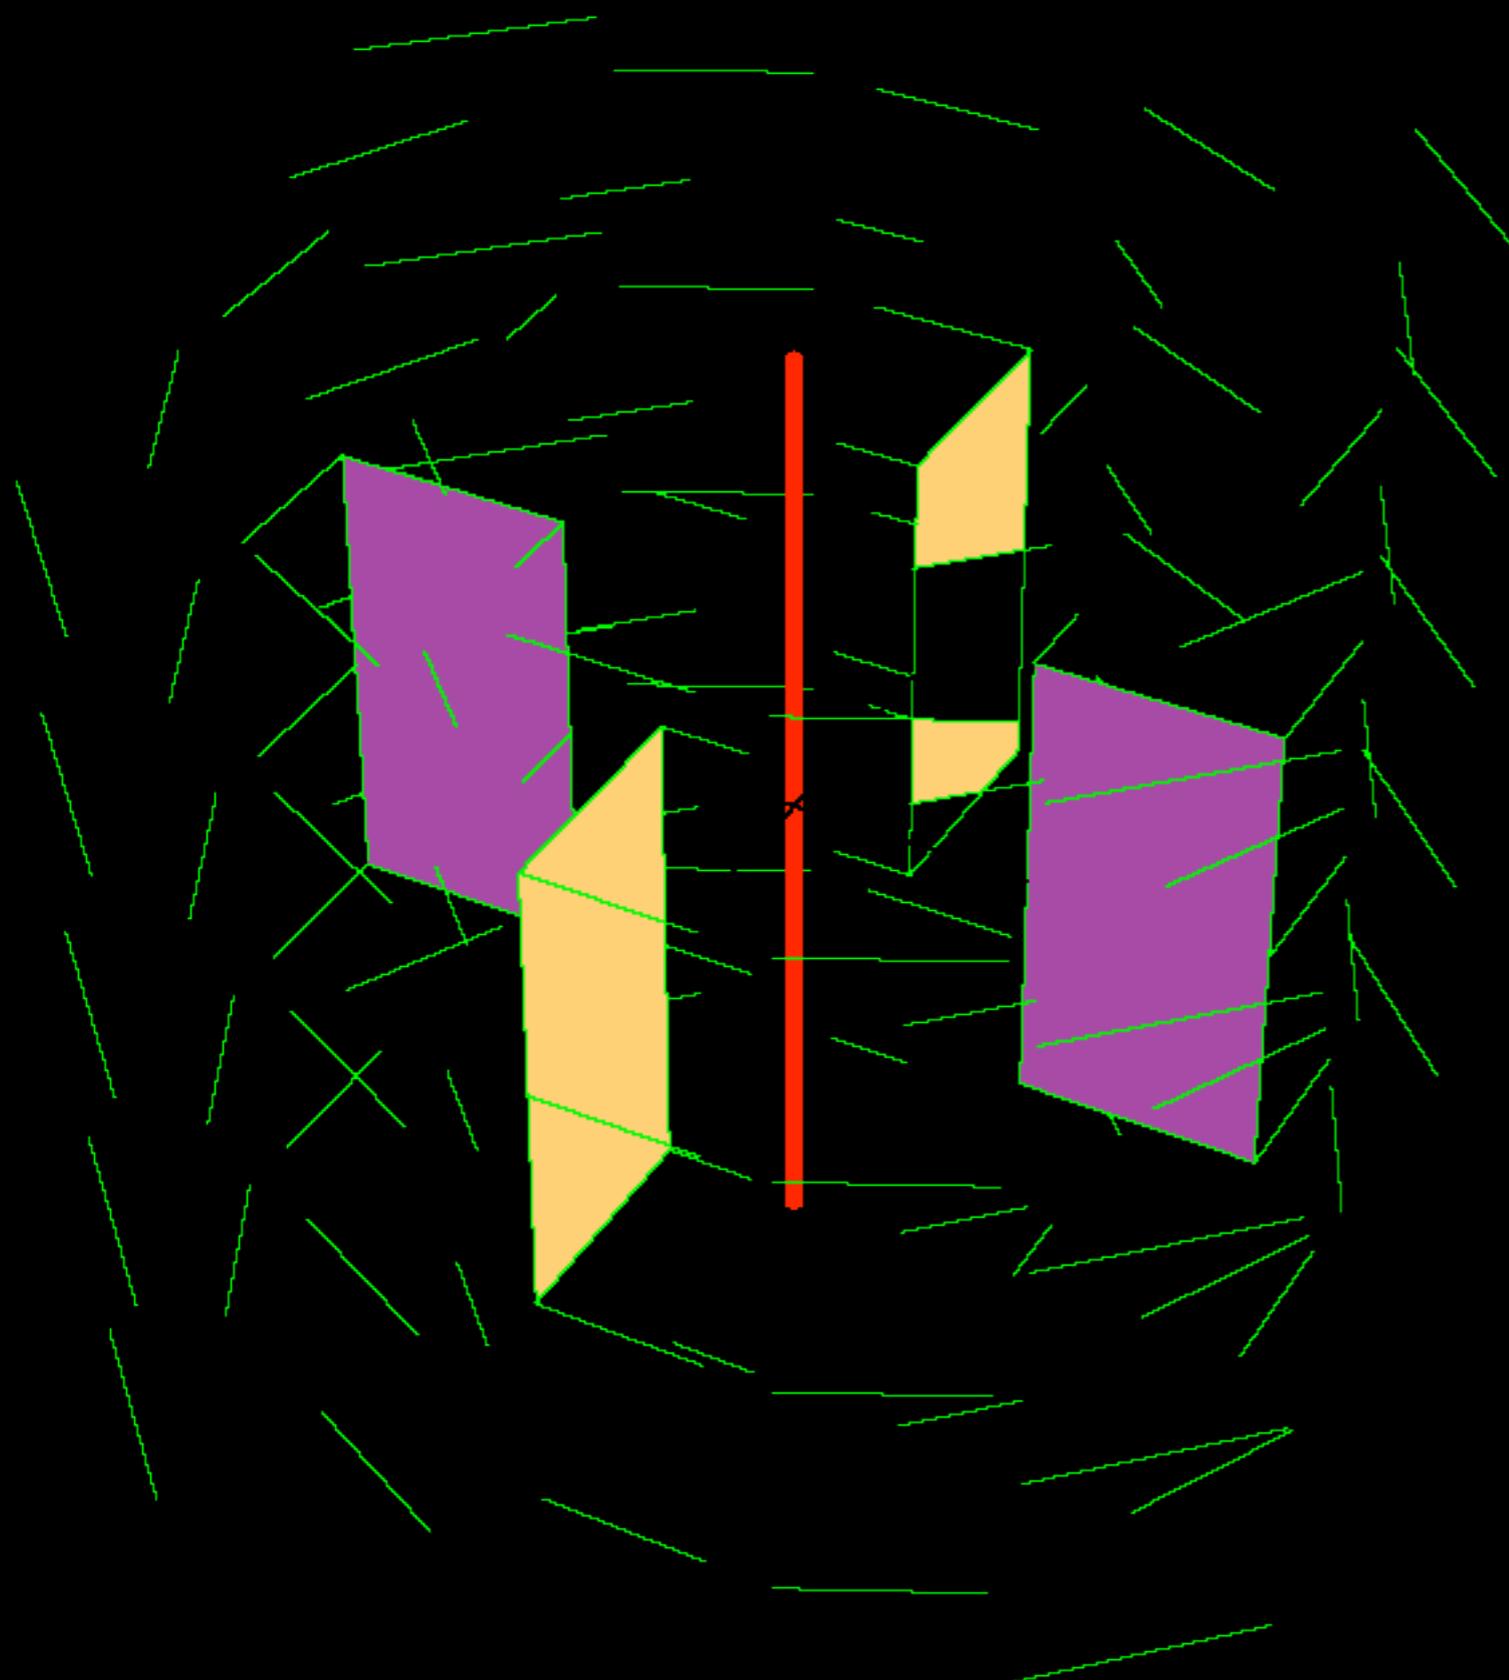

Integrating this over
the surface
gives the flux.

A 3D rendered scene showing a man in a black suit performing a curling maneuver on a vertical pole. The man is positioned horizontally, with his head to the left and feet to the right. He is holding the pole with both hands, one near his head and the other near his feet. The background is a blurred gymnasium with wooden floors and other people in the distance. The text "3D Curl" is overlaid in the center of the image.

3D Curl

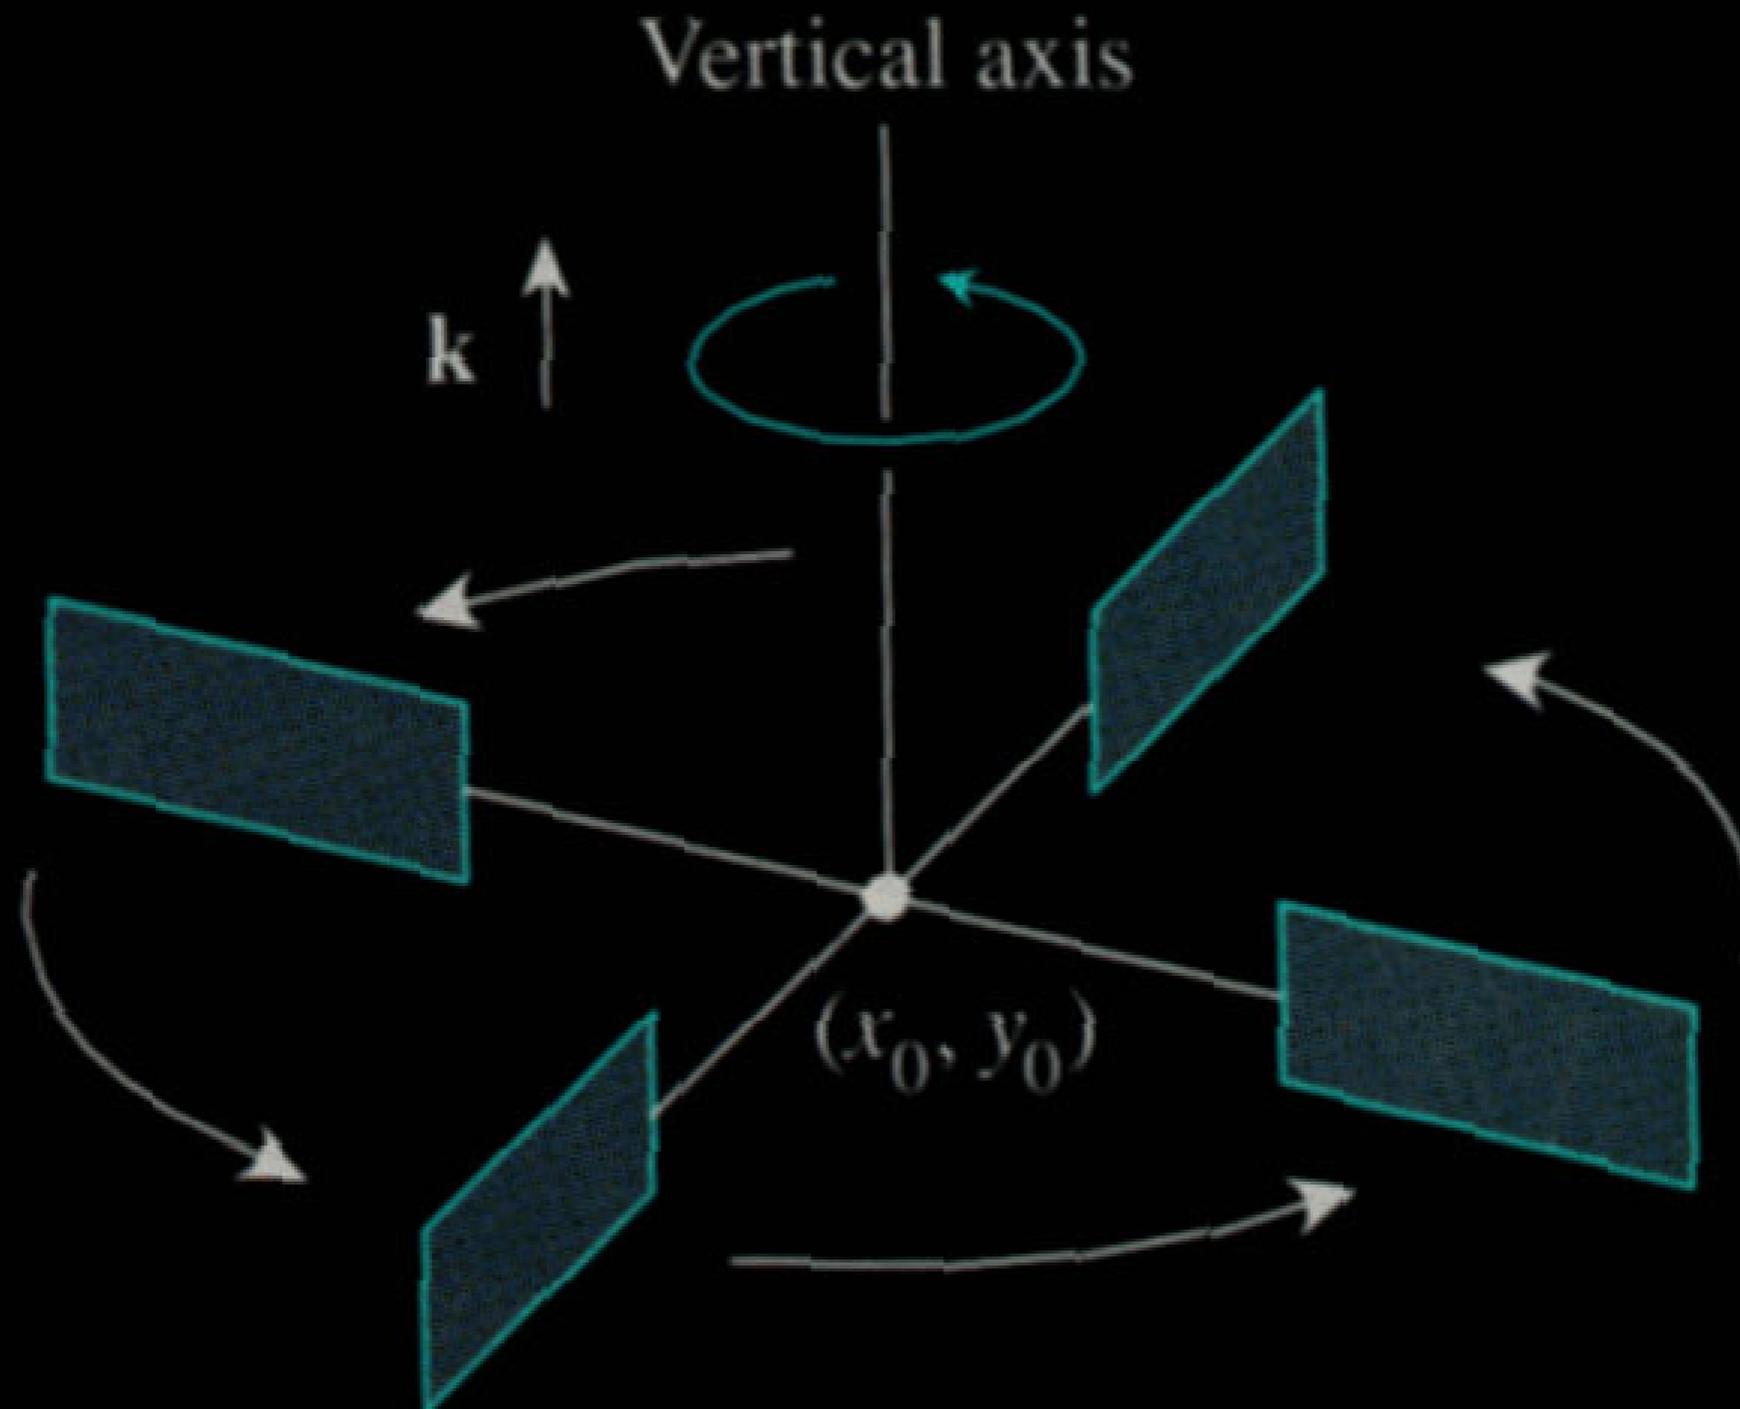

3D Curl

$$\begin{bmatrix} \vec{i} & \vec{j} & \vec{k} \\ \partial_x & \partial_y & \partial_z \\ P & Q & R \end{bmatrix}$$

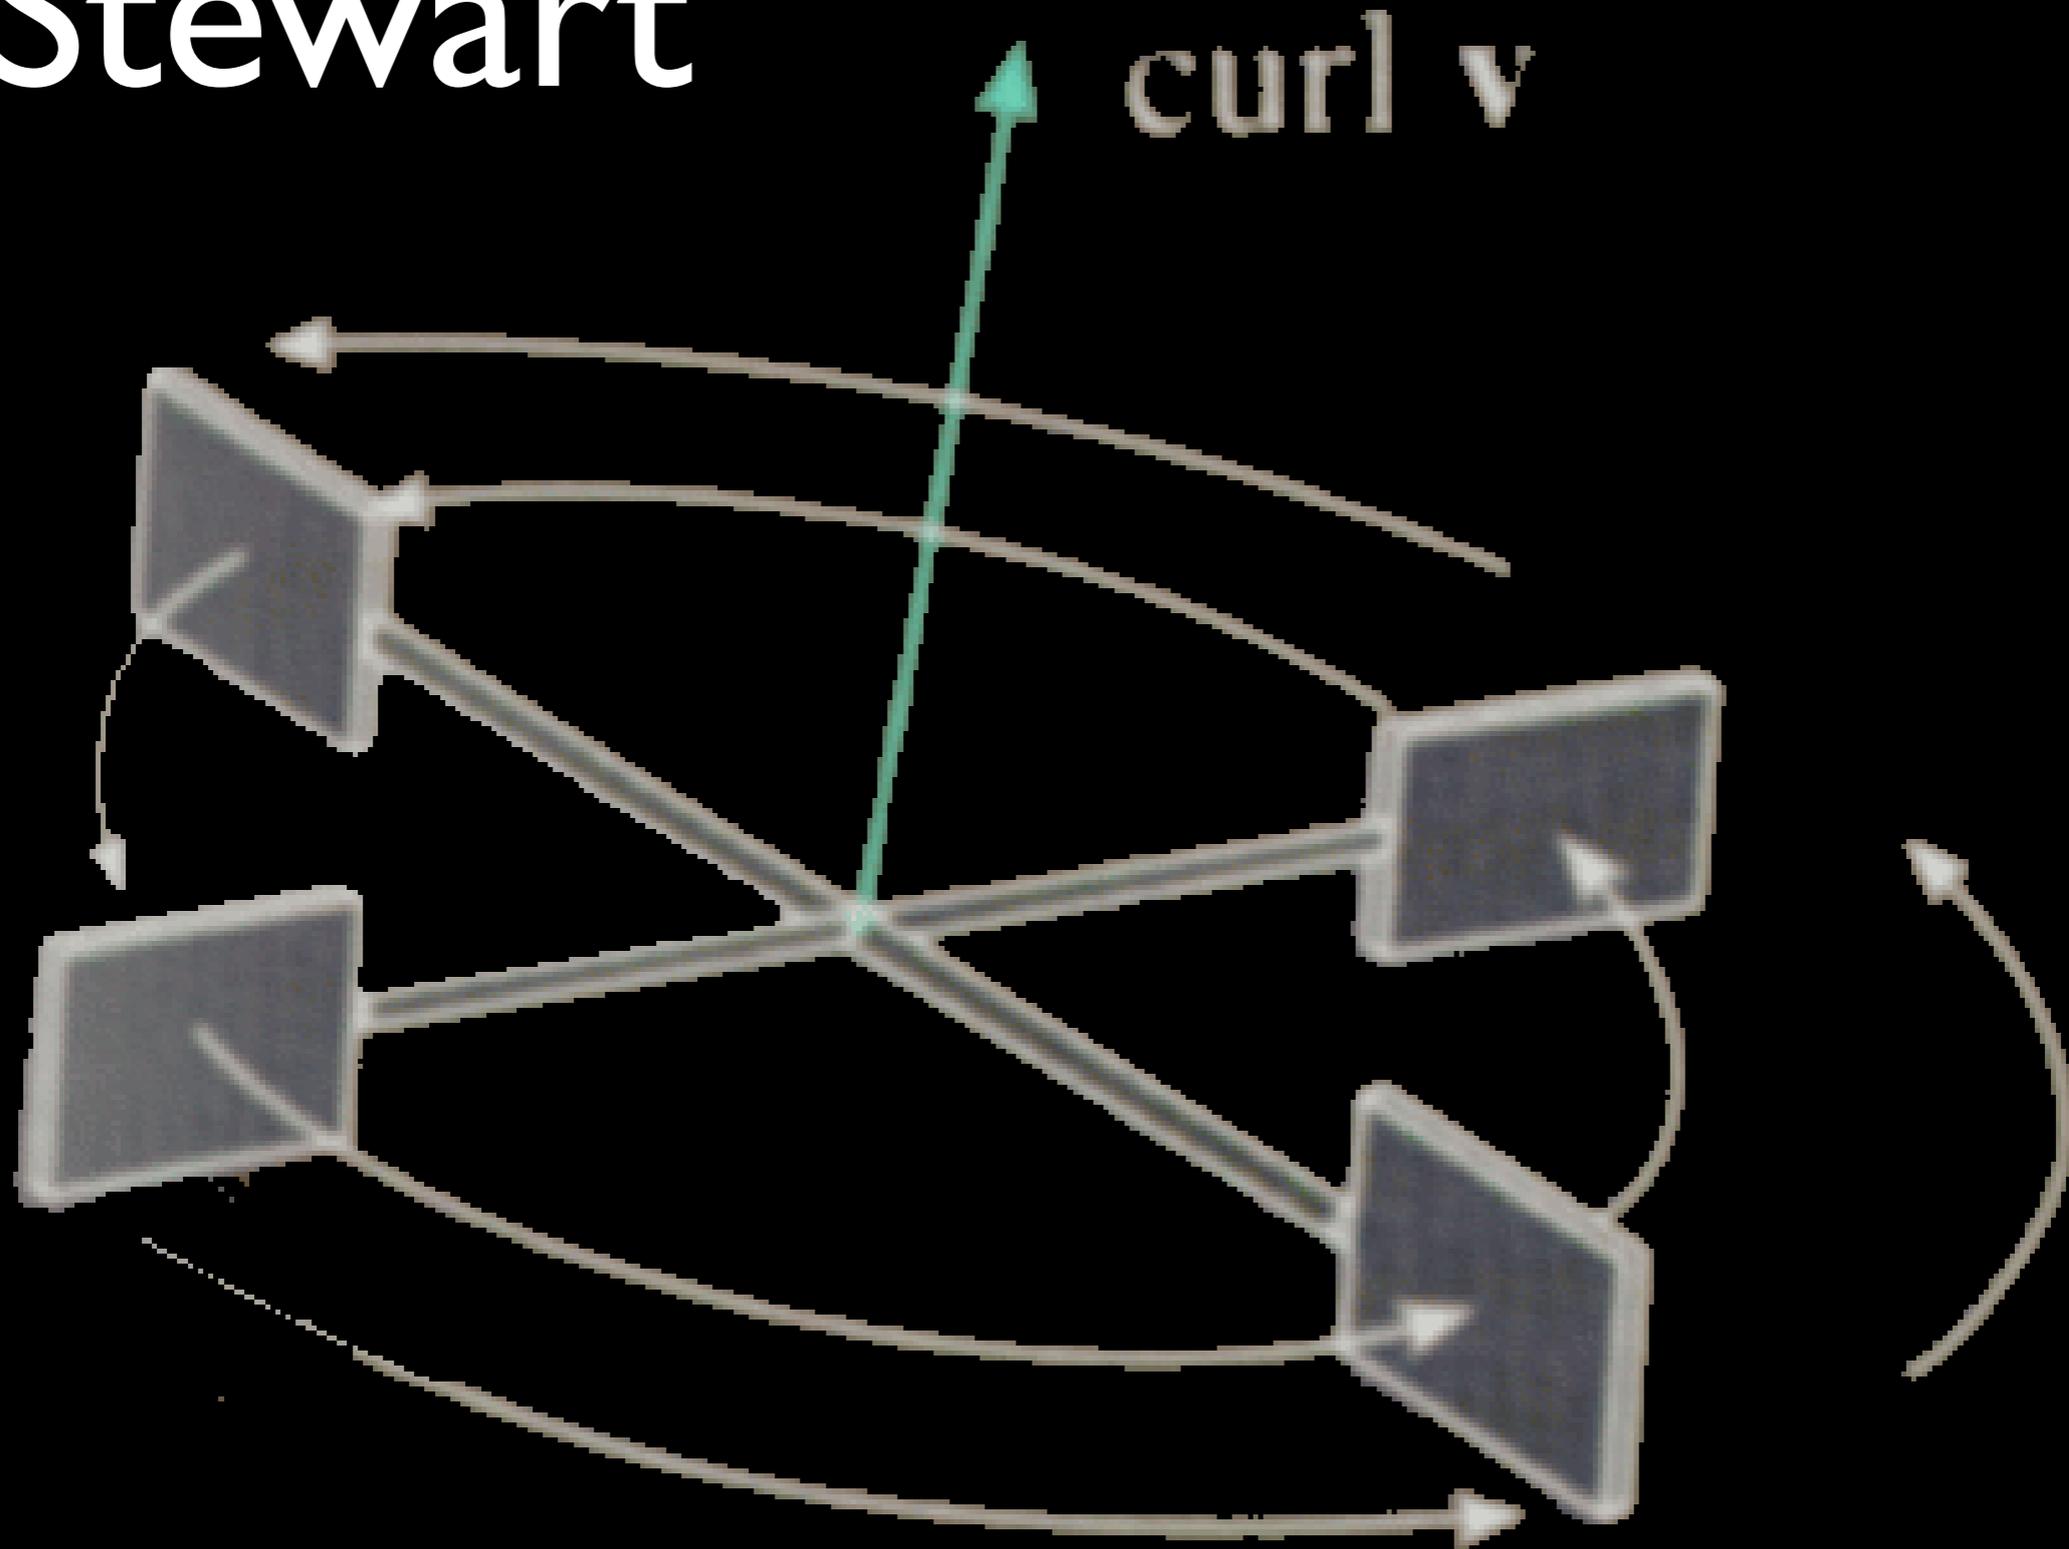

In essentially
all
multivariable
textbooks,
the
paddlewheel
appears.

Thomas

$\text{Curl } \mathbf{F}(x_0, y_0) \cdot \mathbf{k} > 0$
Counterclockwise circulation

Stewart

Edwards-Penny

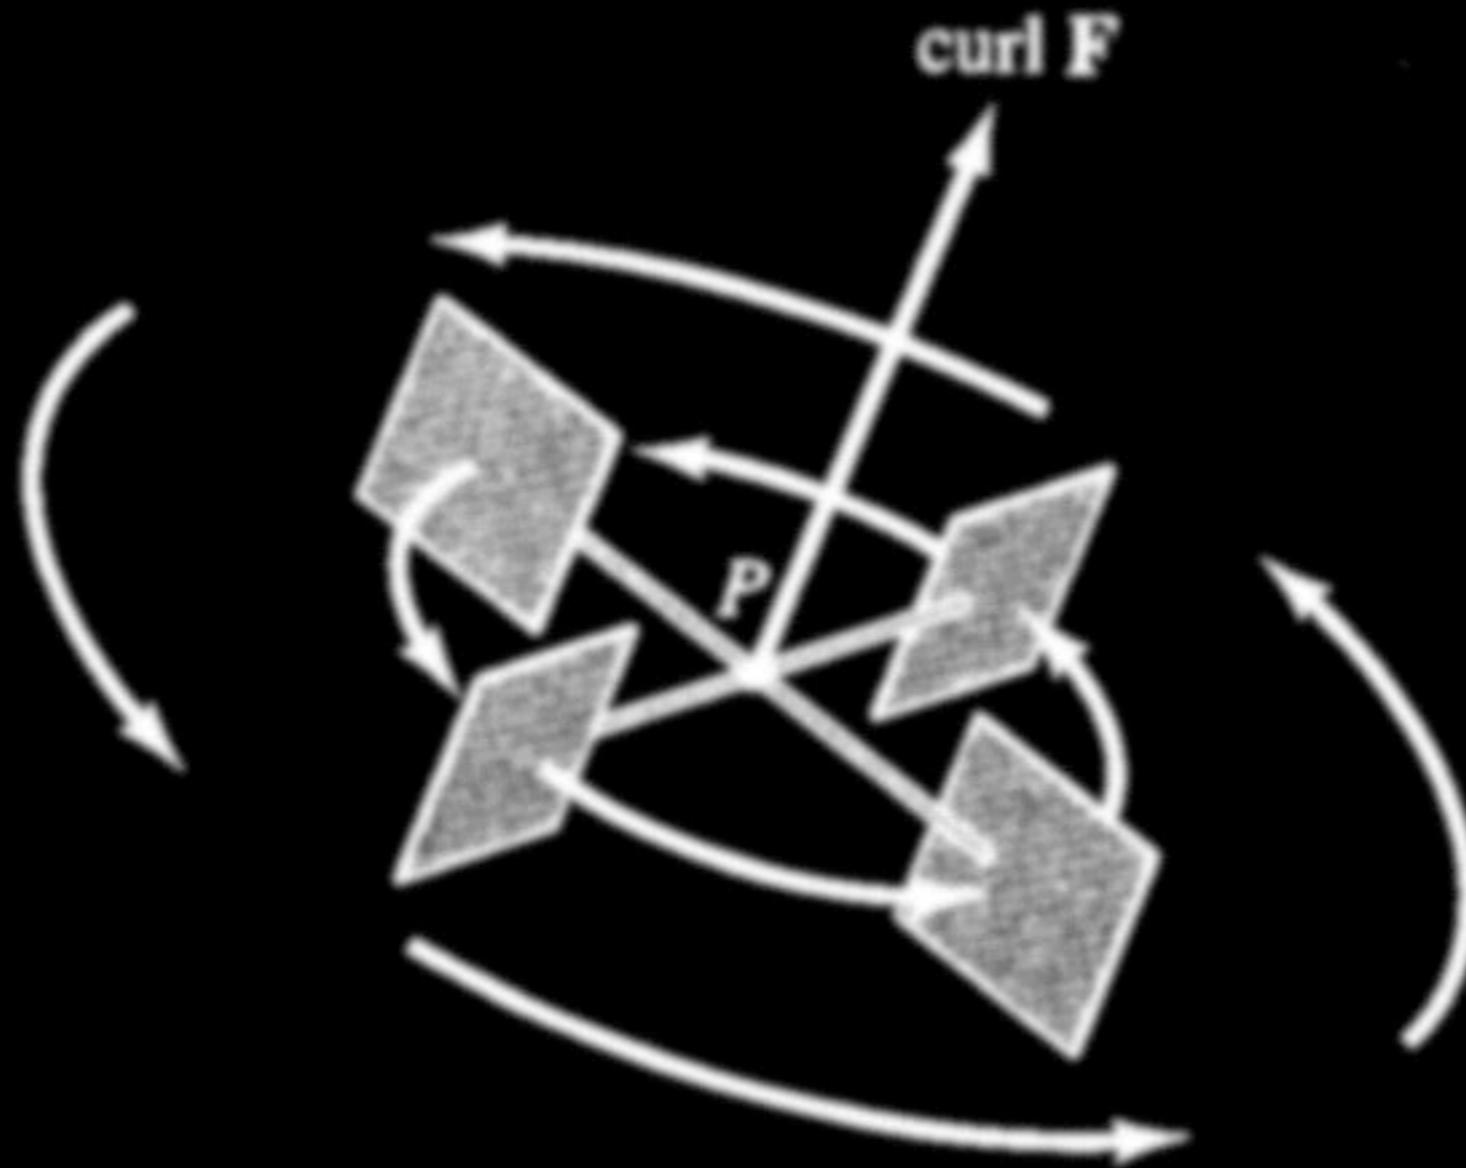

FIGURE 15.7.6 The paddle-wheel interpretation of $\text{curl } \mathbf{F}$.

Marsden Tromba

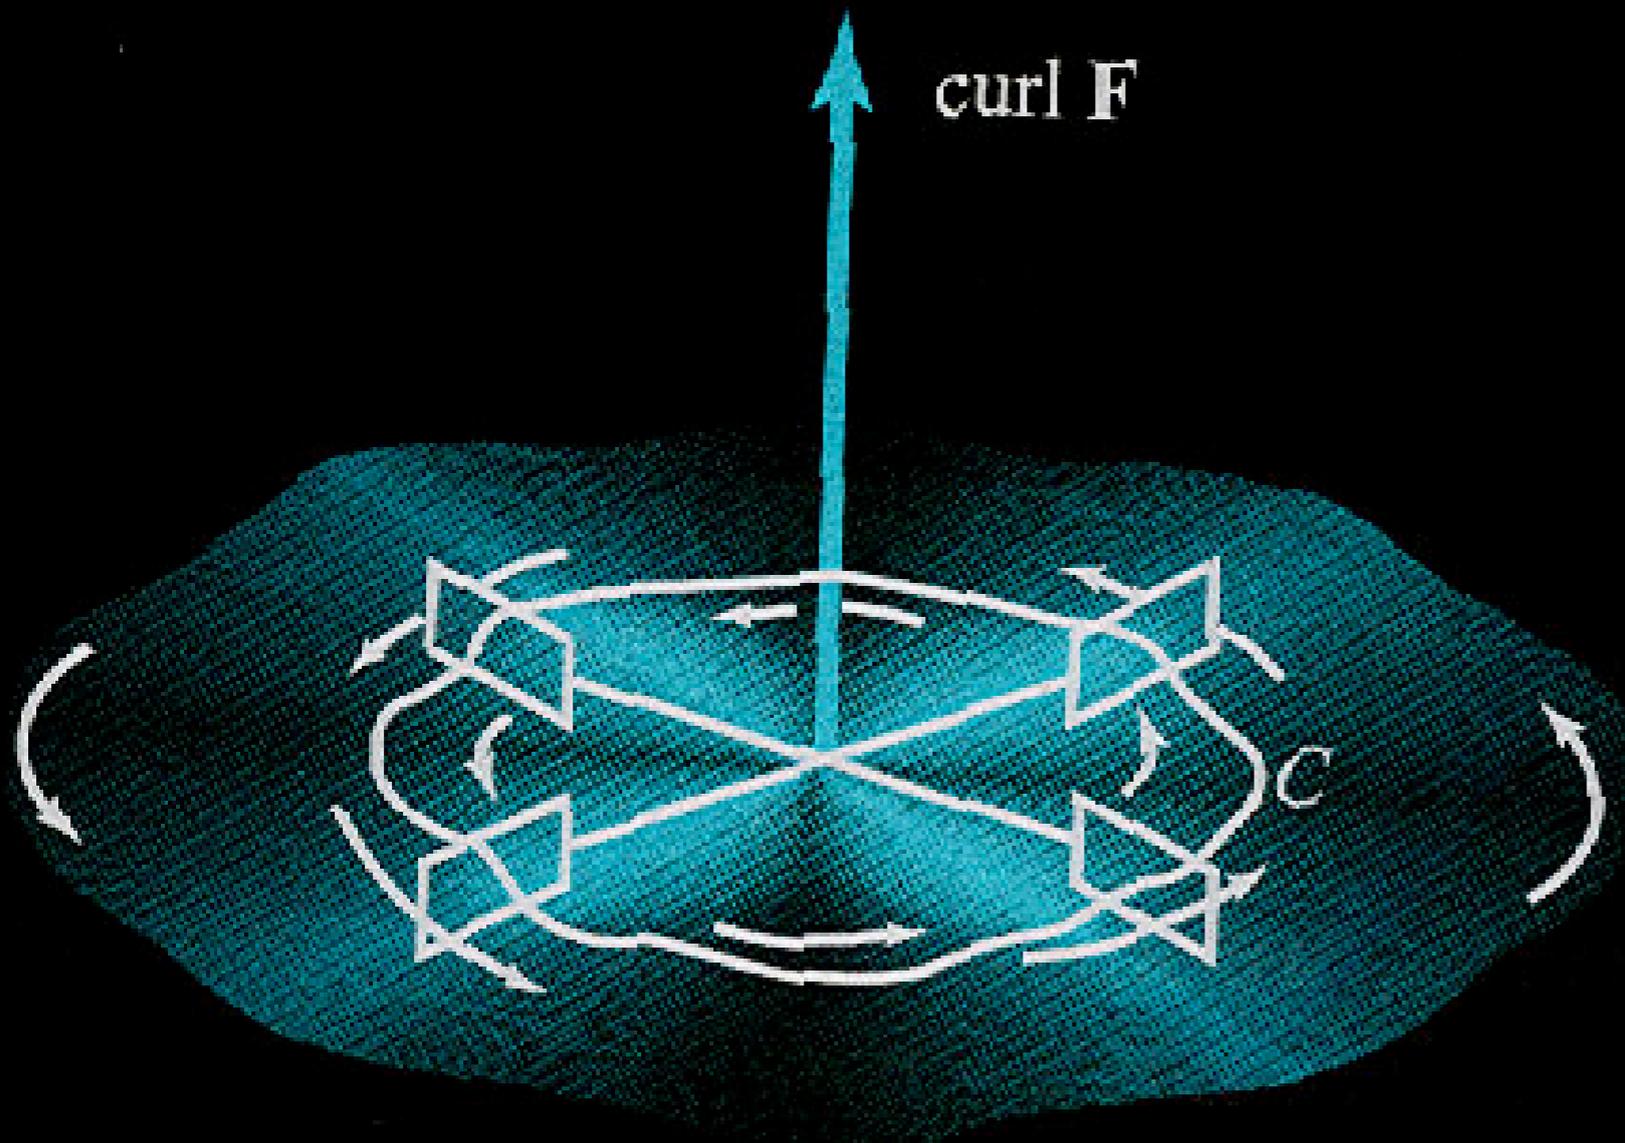

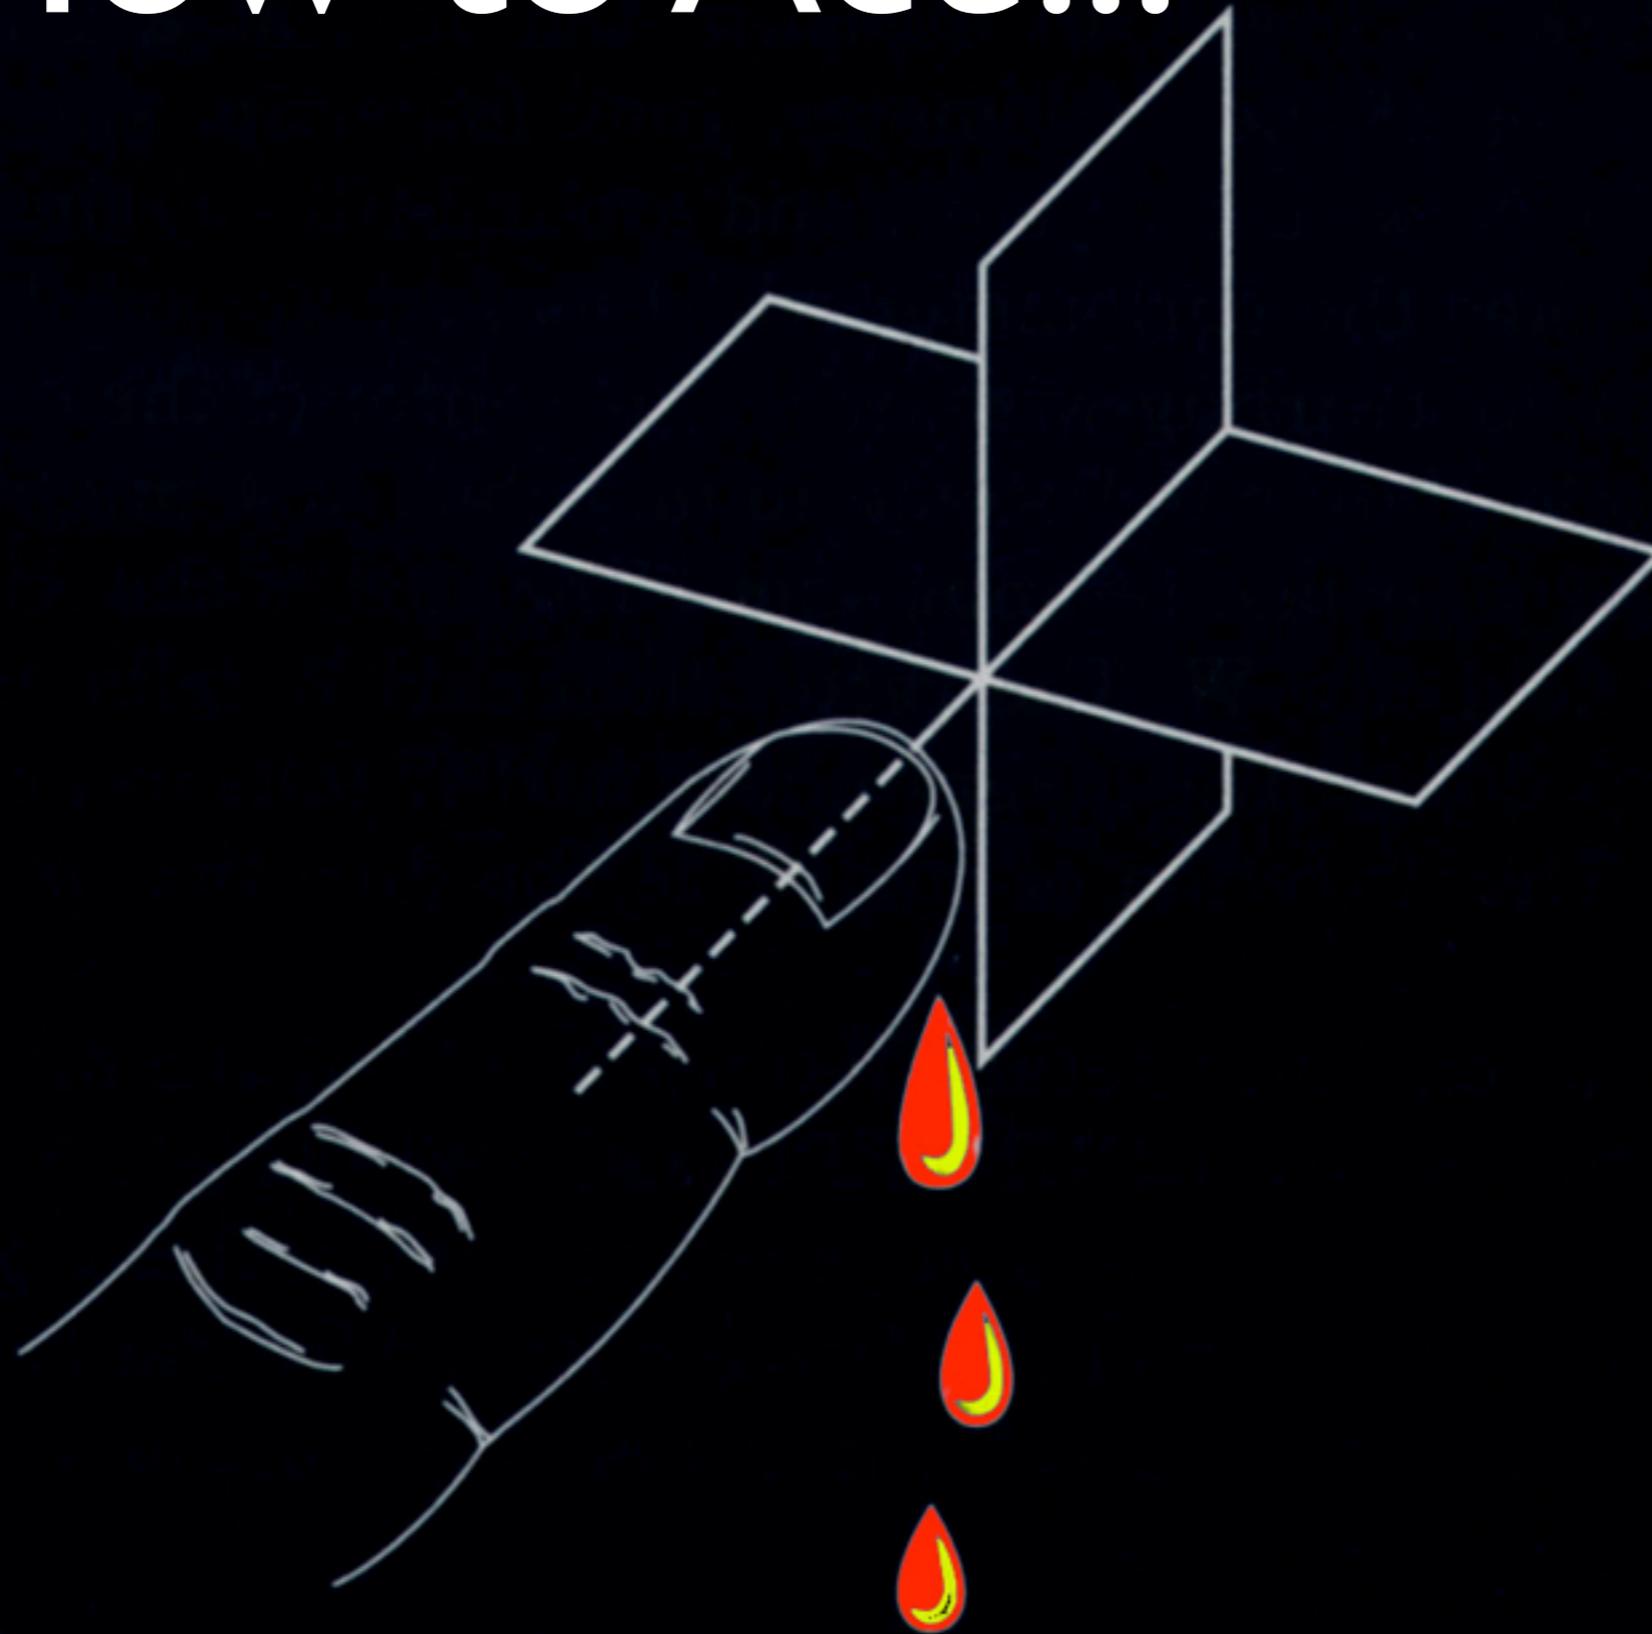

Figure 8.3.4 $\int_C \mathbf{F} \cdot d\mathbf{r}$
paddle wheel in a fluid
rotate around its axis.

How to Ace...

The wind velocity
around Harvard
yard is

$$F(x,y,z) = (2x, \sin(x), yz)$$

Is this a
conservative field?

How fast rotates
the wheel at the
point $(1, 1, 3)$

Curl

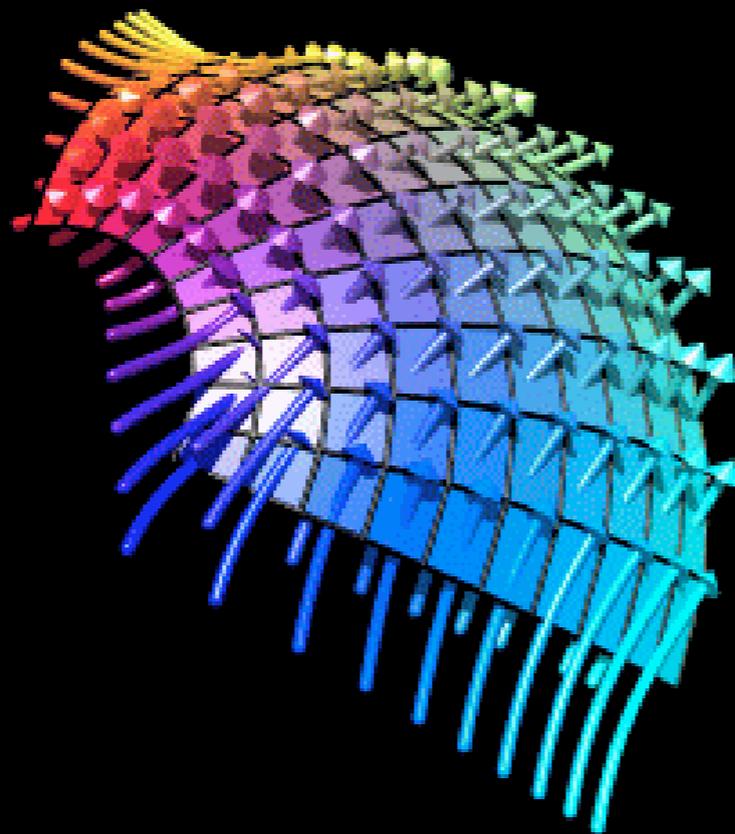

Stokes

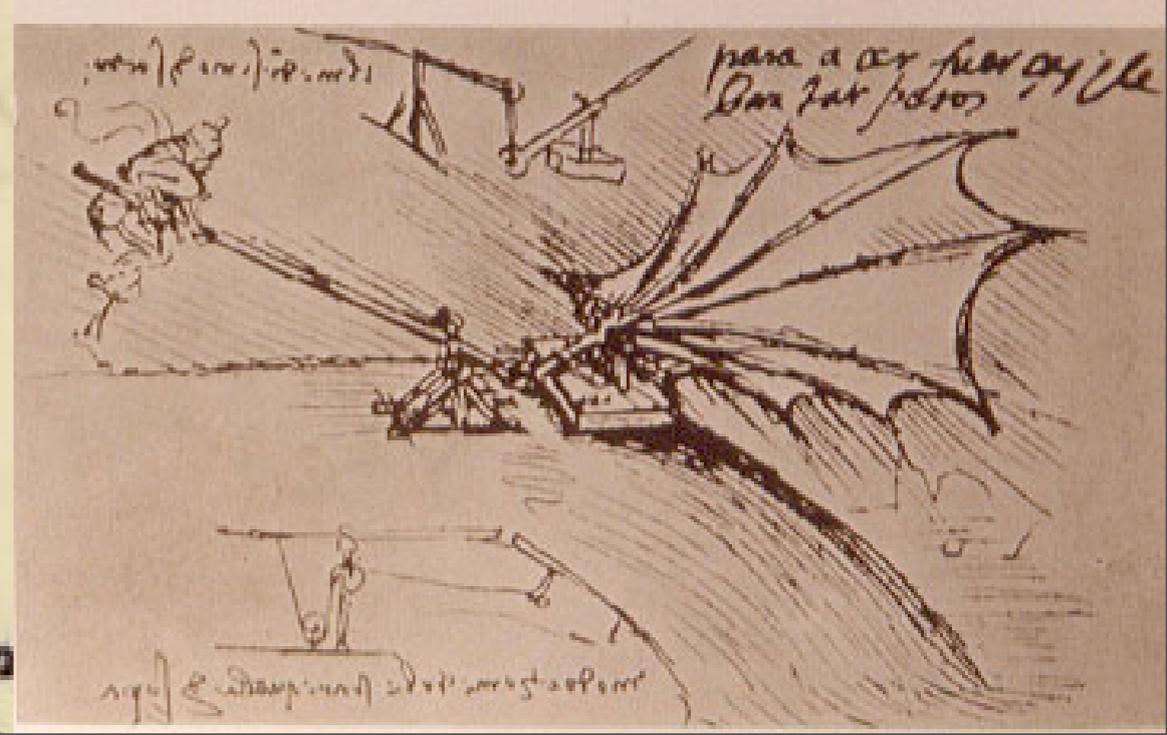

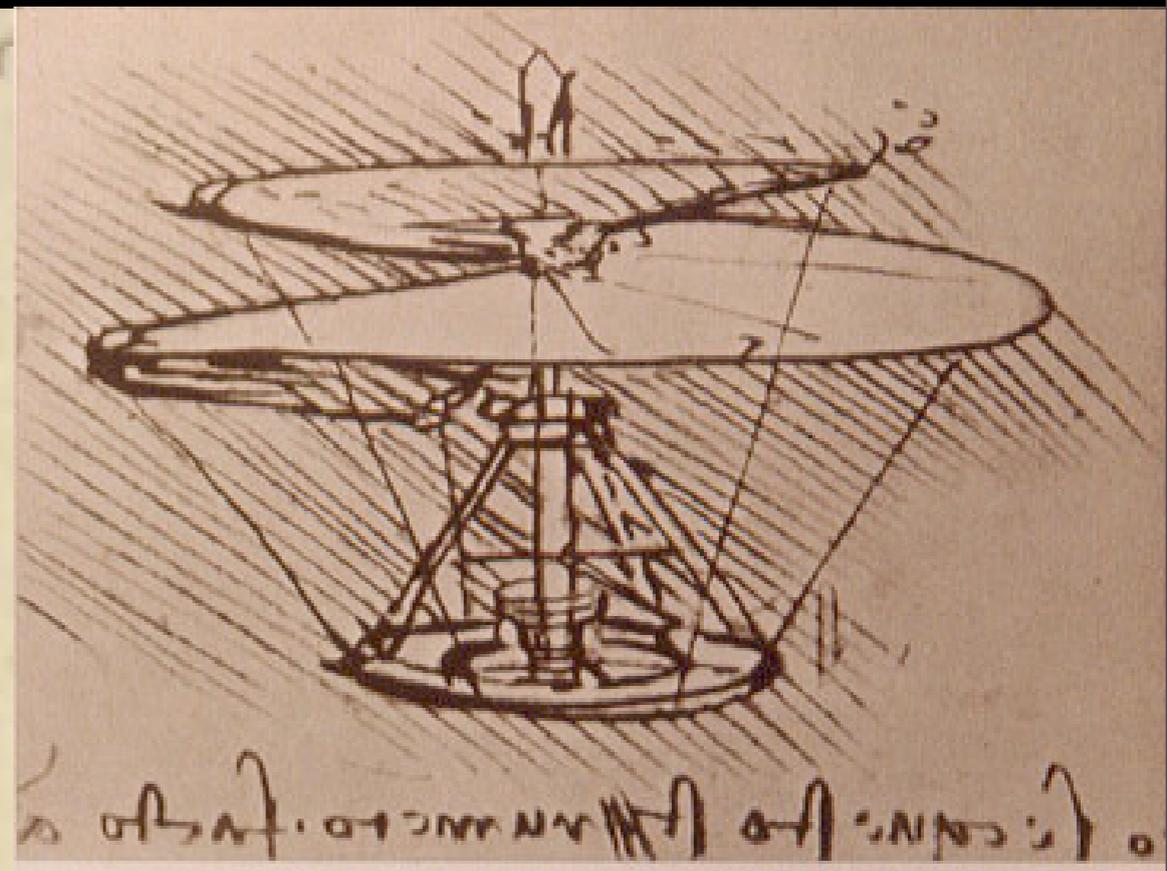

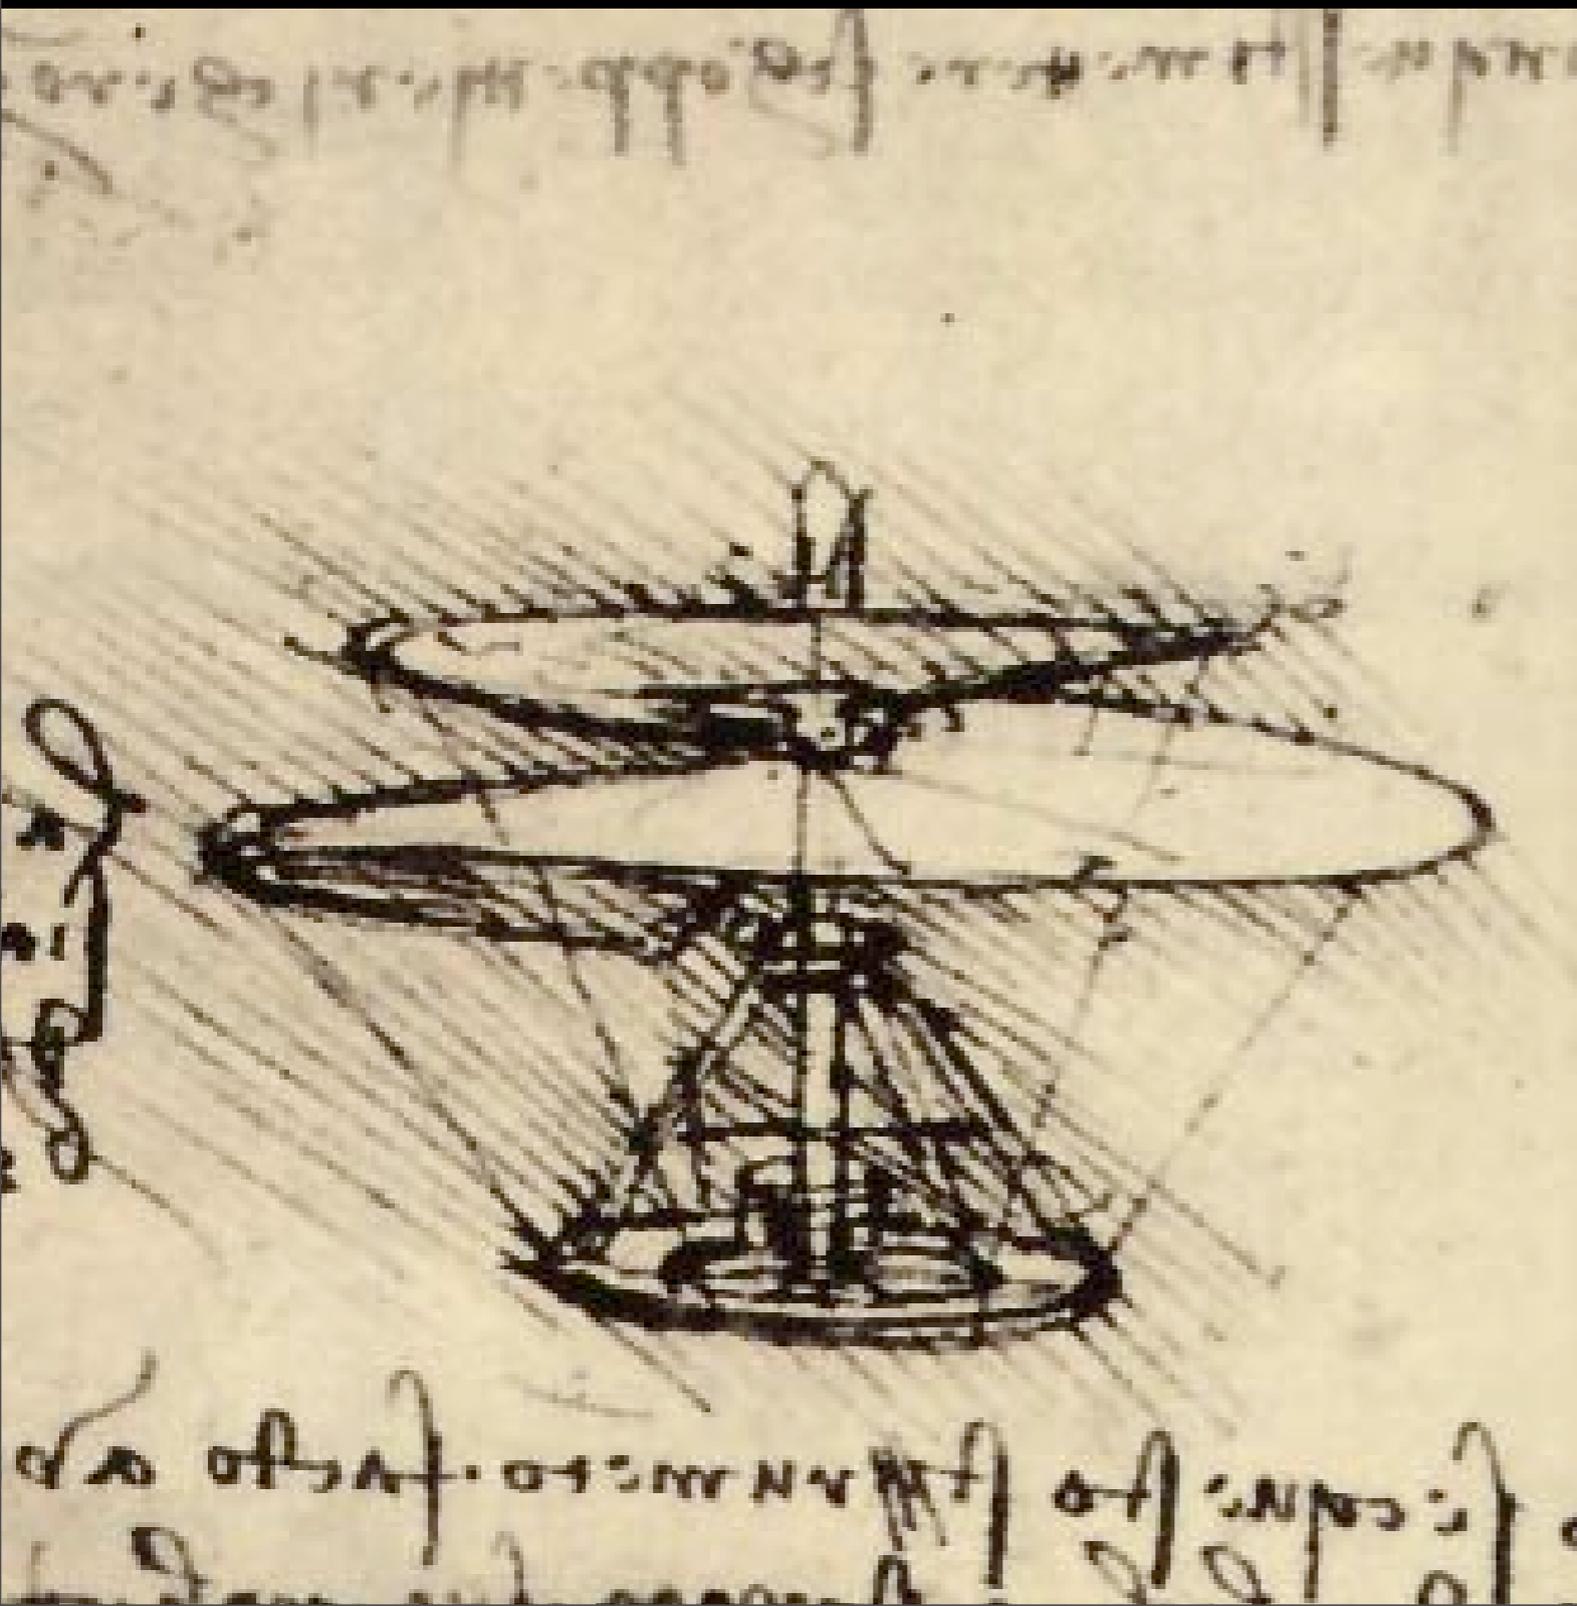

Stokes Theorem

$$\text{curl}(P, Q, R) = (R_y - Q_z, P_z - R_x, Q_x - P_y)$$

$$\int_C F \cdot dr = \int \int_S \text{curl}(F) \cdot dS$$

This result was not known to Da Vinci..

but it is important for the
design of modern aircraft

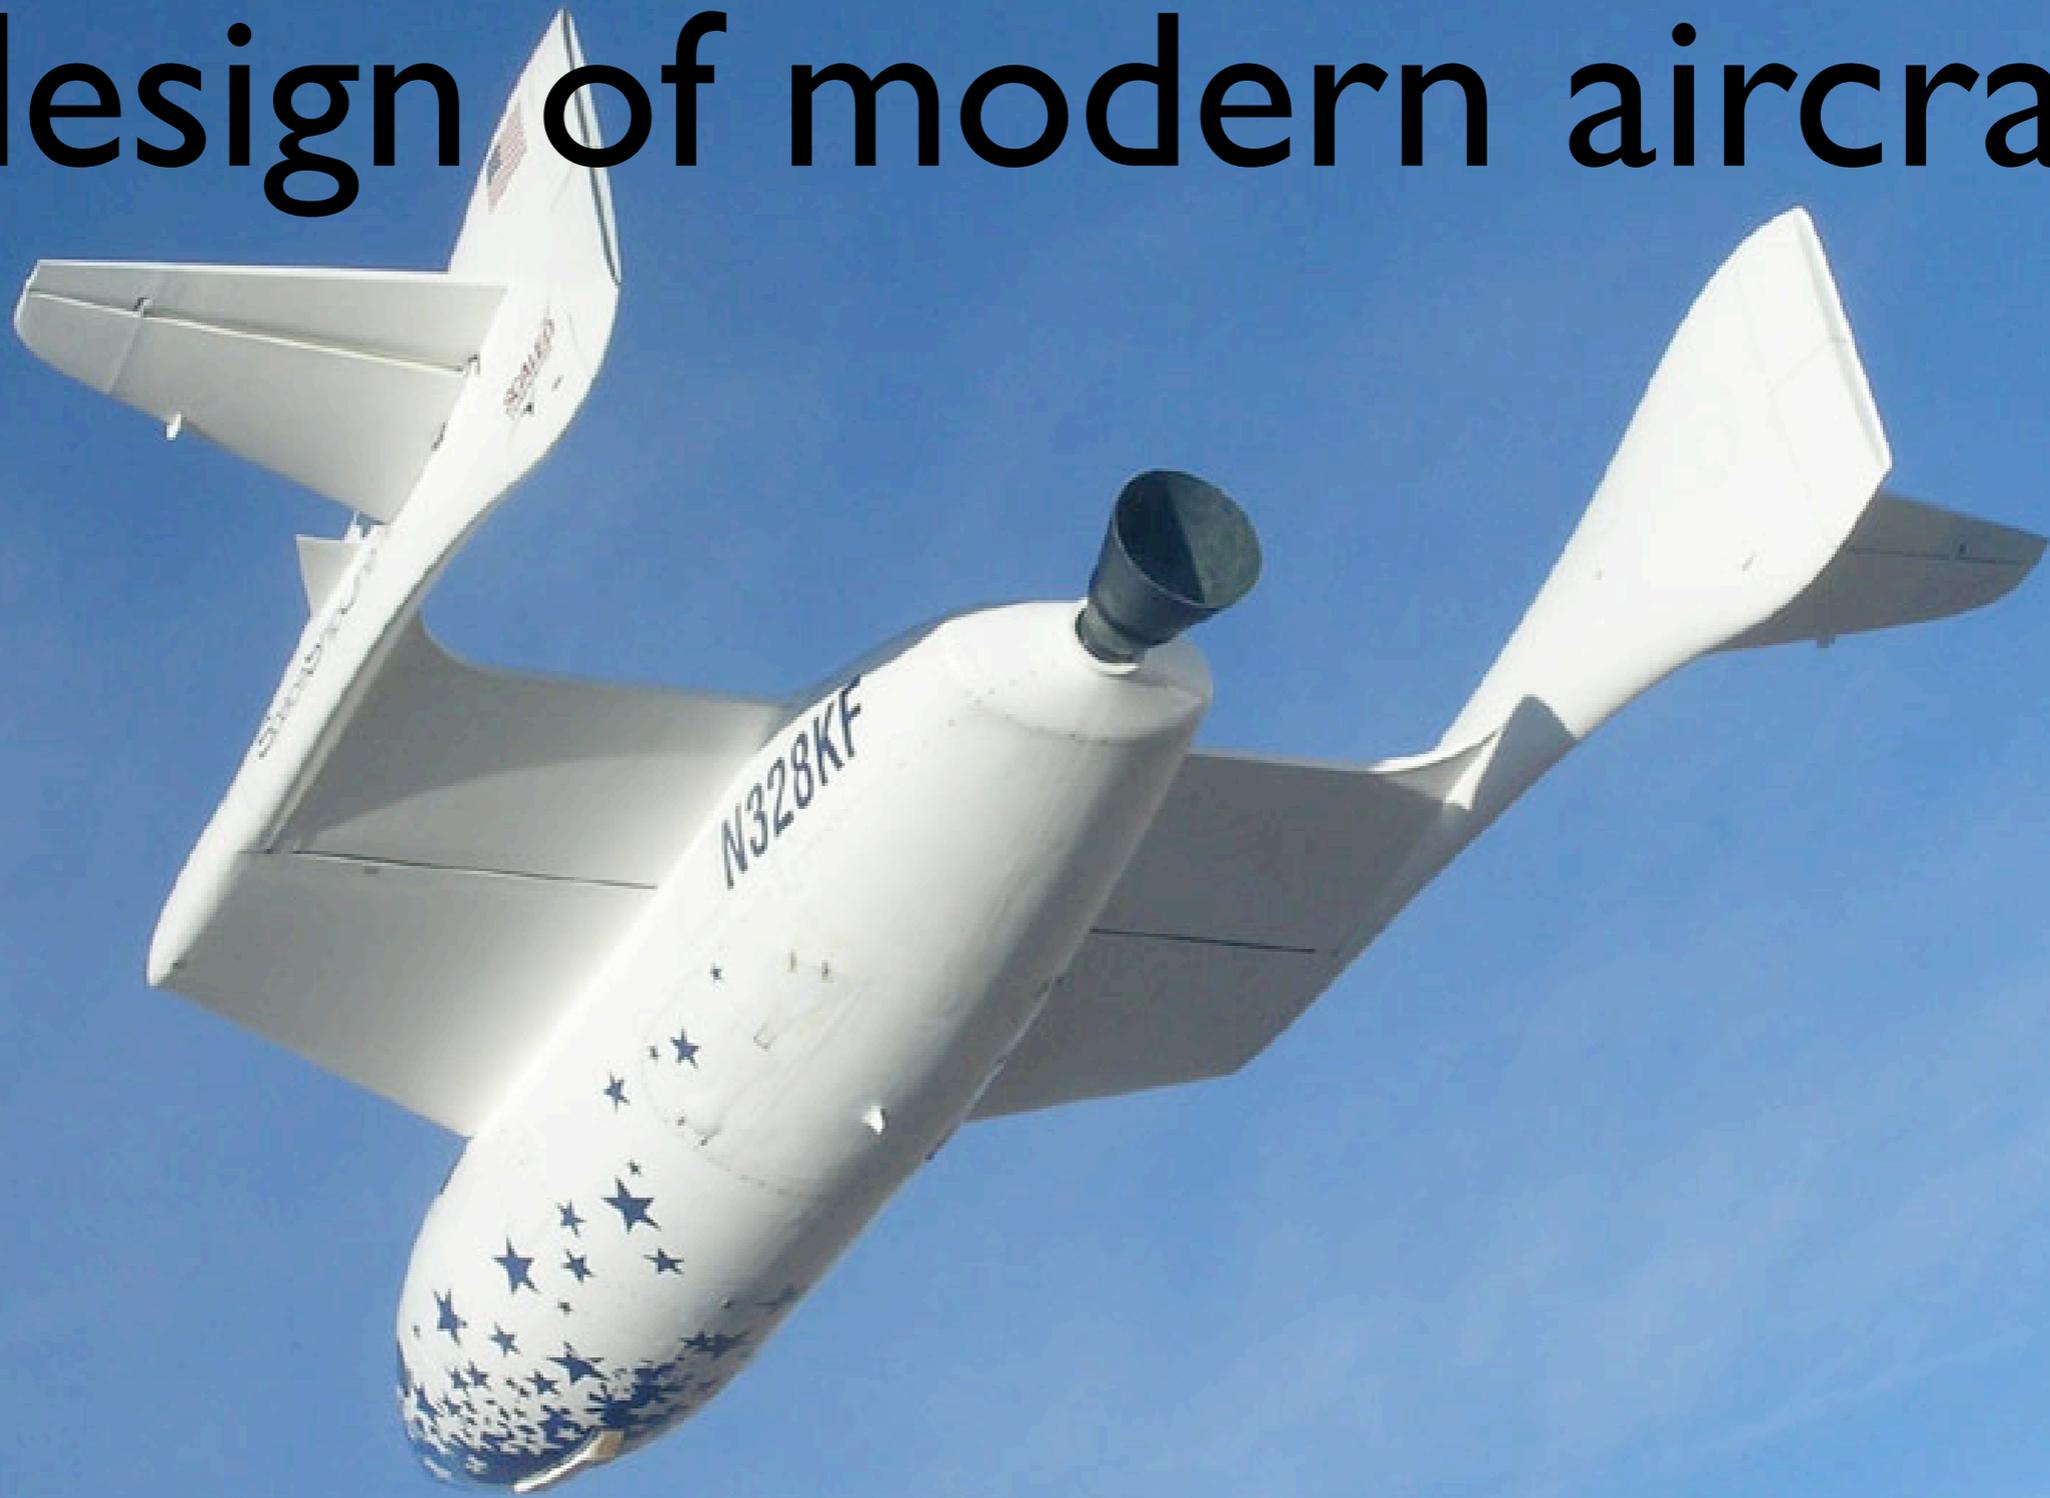

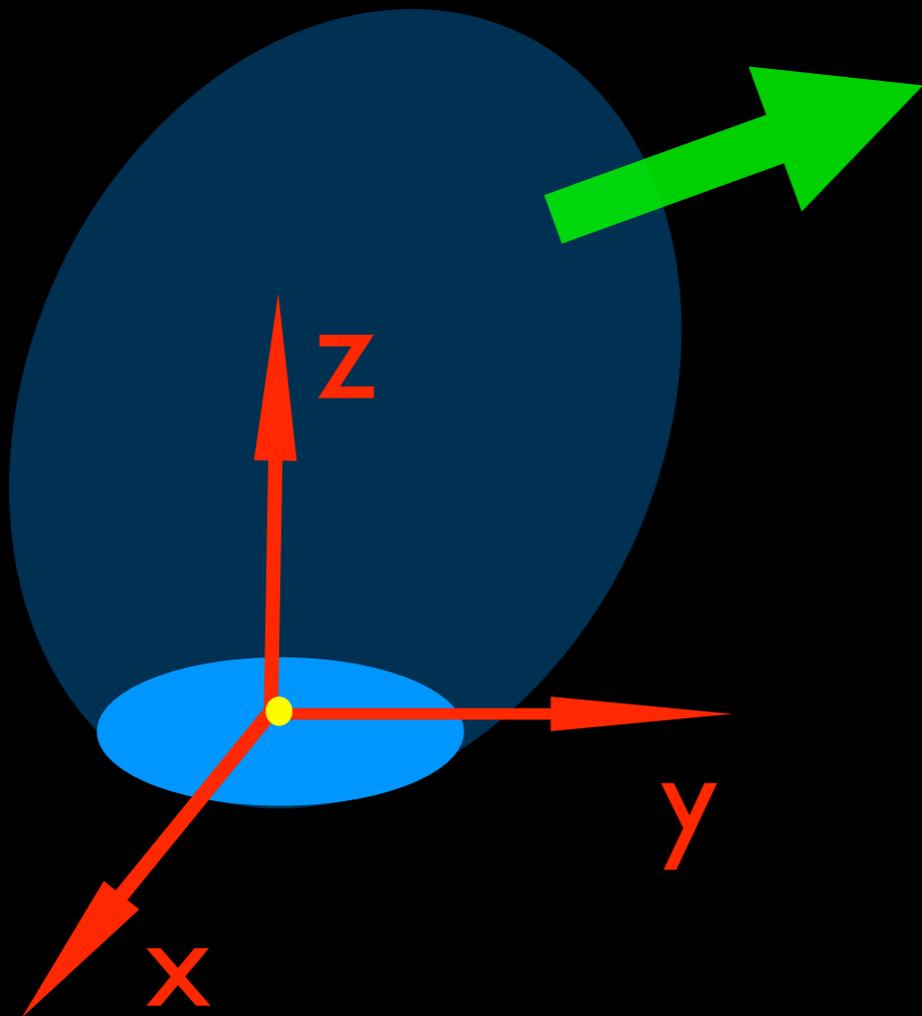

PHOTO COURTESY OF SCALED COMPOSITES, LLC

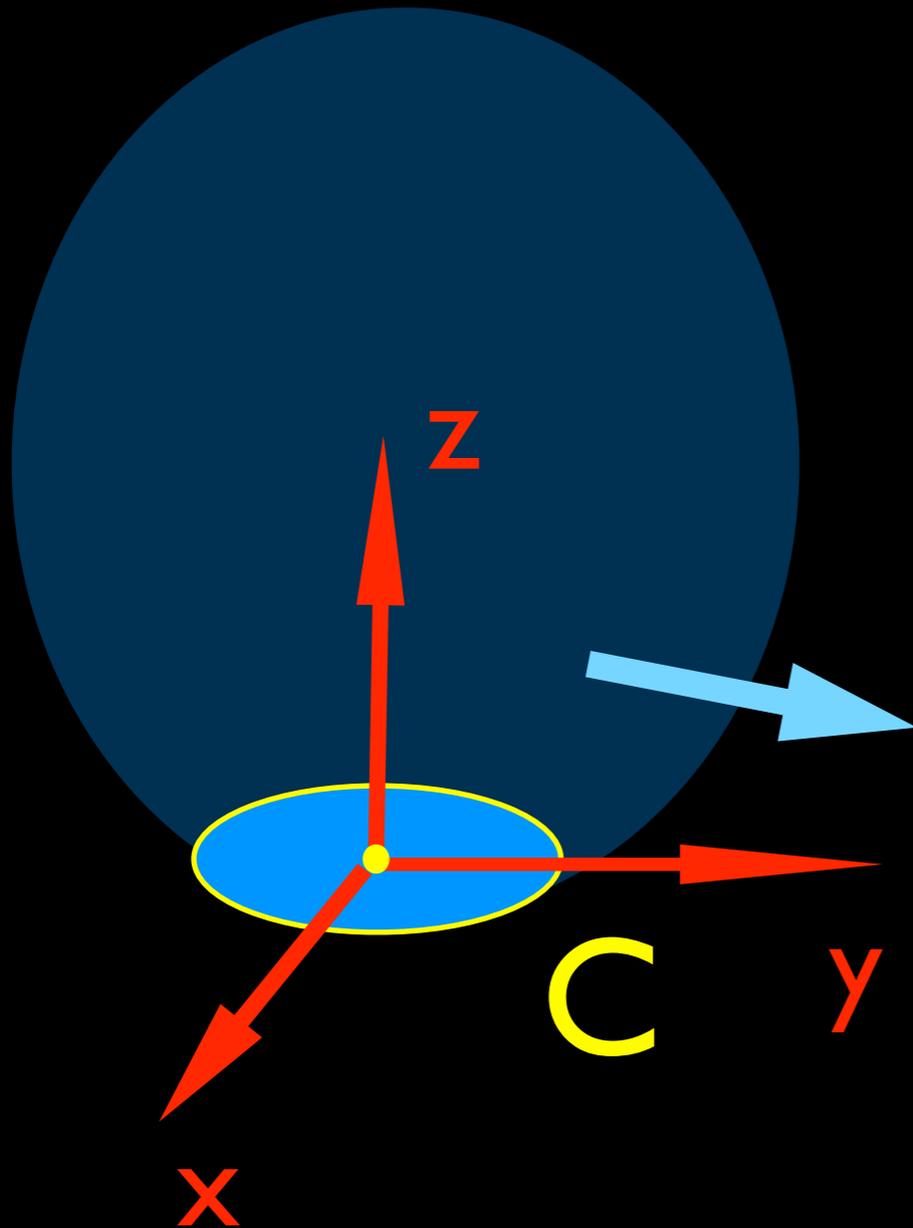

Blimp Problem

The velocity field in a hot air balloon is $F = \text{curl}(G)$, where $G = (-y, x, 0)$. What is the flux of F through the surface of a hot air balloon for which the opening is the unit circle in the xy plane

Use Stokes Theorem

The flux of $\text{curl}(F)$ through the balloon is equal to the lineintegral of $F=(-y,x,0)$ along the boundary curve C .

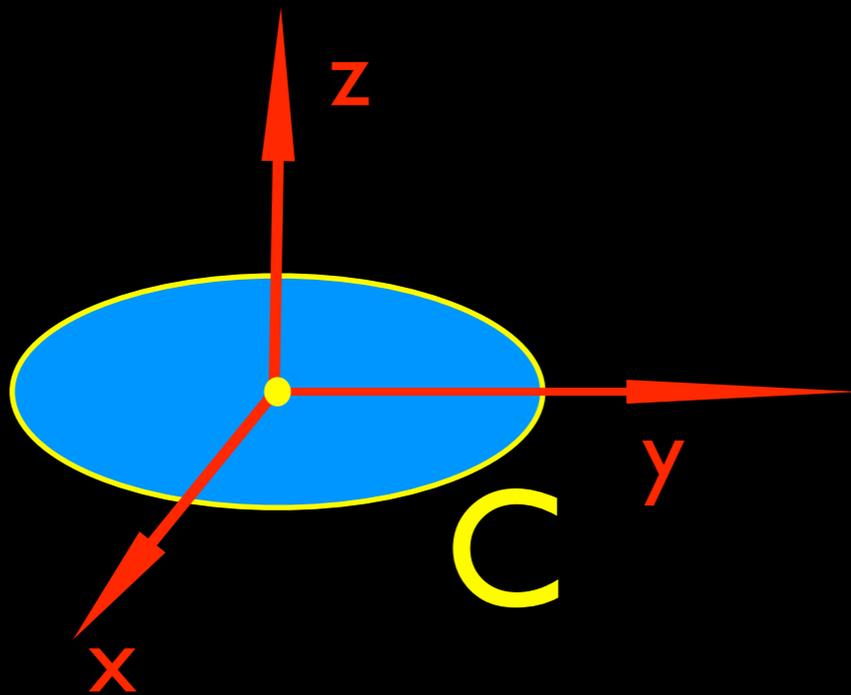

Use Stokes Theorem

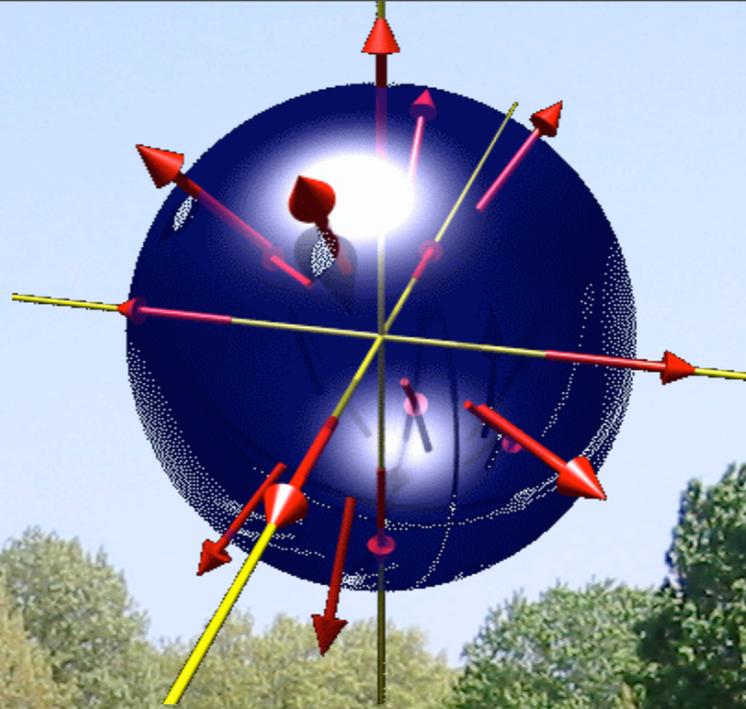

$$C: r(t) = (\cos(t), \sin(t), 0). r'(t) = (-\sin(t), \cos(t), 0)$$

$$F(r(t)) = (-\sin(t), \cos(t), 0)$$

$$F(r(t)) \cdot r'(t) = 1$$

The line integral is 2π , and so is the flux.

The divergence theorem

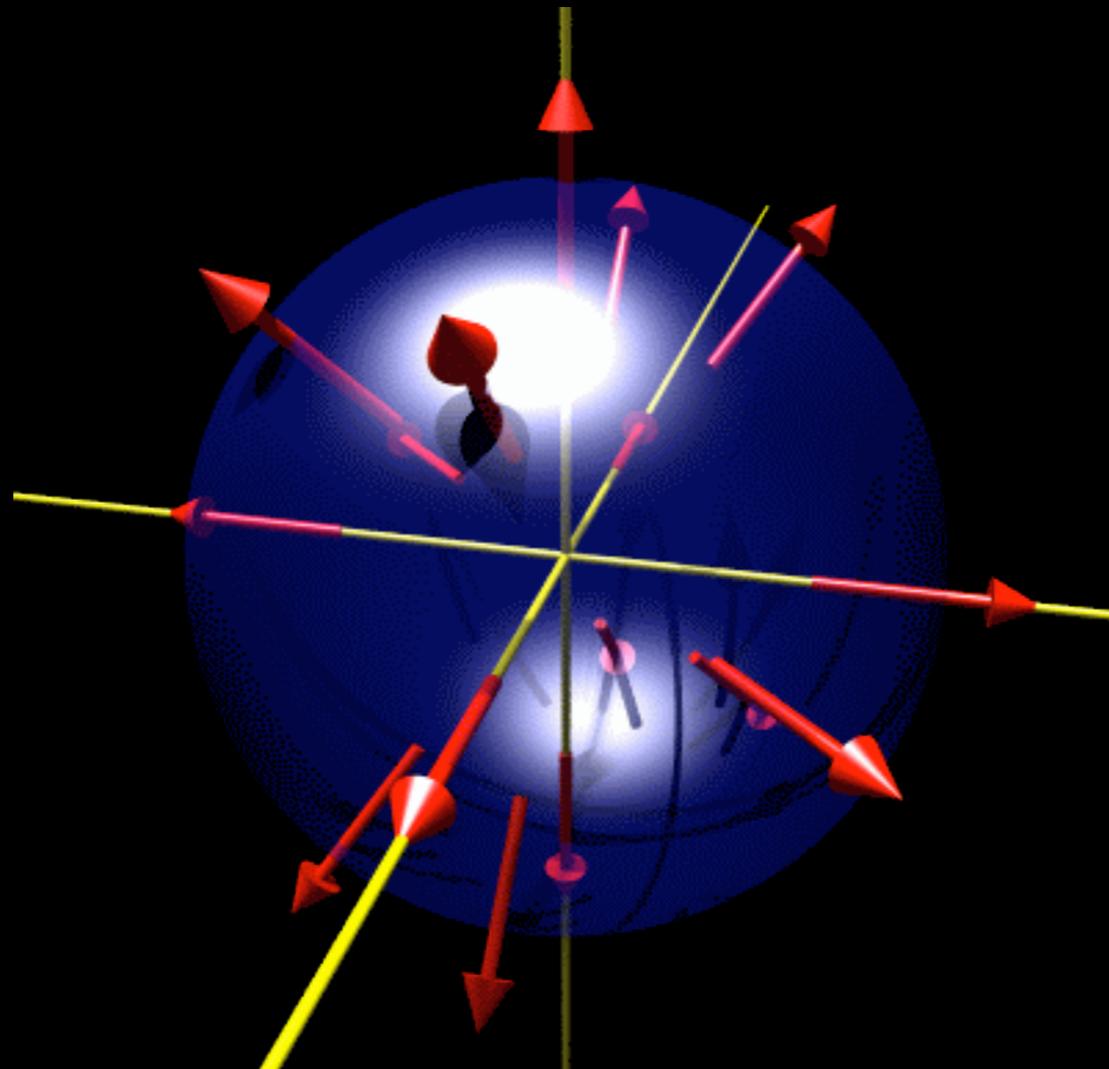

Divergence Theorem

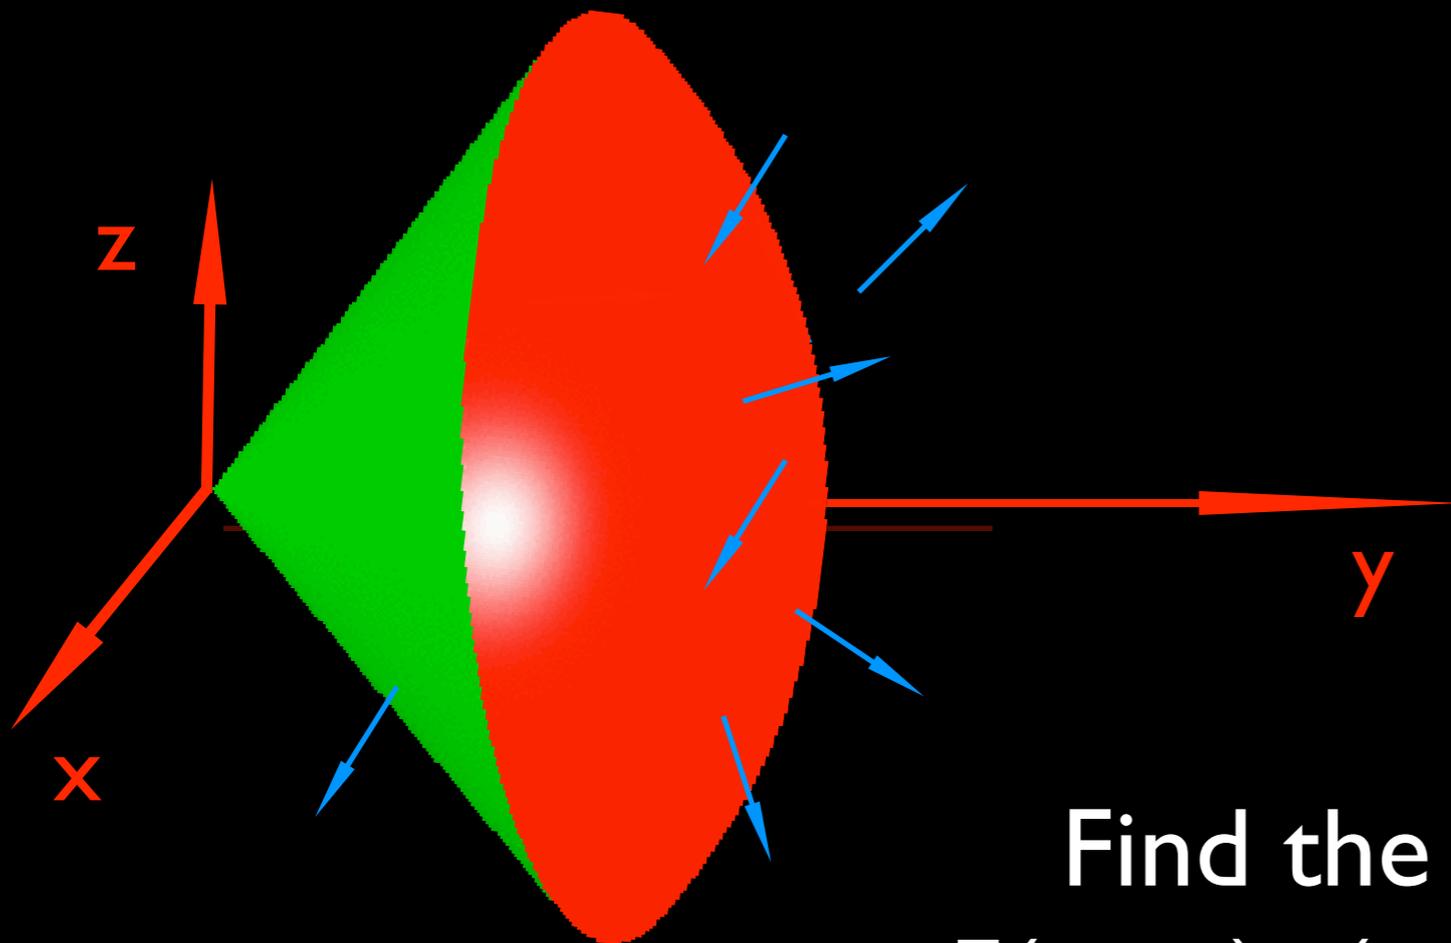

Divergence Theorem

$$\operatorname{div}(F) = P_x + Q_y + R_z$$

$$\int \int_S F \cdot dS = \int \int \int_E \operatorname{div}(F) dV$$

Problem

Find the flux of the vector field $F(x,y,z)=(x-\sin(y), y+1, \log(3+y \sin(x)))$ through the cone $|x|=|z|$ intersected with $y>0$ and $0<|(x,y,z)|<2$

Derivatives Overview

$$\text{grad}(f) = (f_x, f_y)$$

$$\text{curl}(F) = Q_x - P_y$$

$$\text{grad}(f) = (f_x, f_y, f_z)$$

$$\text{curl}(F) = (R_y - Q_z, P_z - R_x, Q_x - P_y)$$

$$\text{div}(F) = P_x + Q_y + R_z$$

Integrals Overview

line and flux integrals:

$$\int_C F \cdot dr = \int_C F(r(t)) \cdot r'(t) dt$$

$$\int \int_S F \cdot dS = \int \int_R F(r(u, v)) \cdot (r_u \times r_v) dudv$$

length and area:

$$\int_C 1 ds = \int_a^b |r'(t)| dt$$

$$\int \int_S 1 dS = \int \int_R |r_u \times r_v| dudv$$

double and triple integrals:

Integral Theorems

$$\int_C \nabla f \cdot dr = f(r(b)) - f(r(a))$$

$$\int \int_R \text{curl}(F) dA = \int_C F \cdot dr$$

$$\int \int_S \text{curl}(F) \cdot dS = \int_C F \cdot dr$$

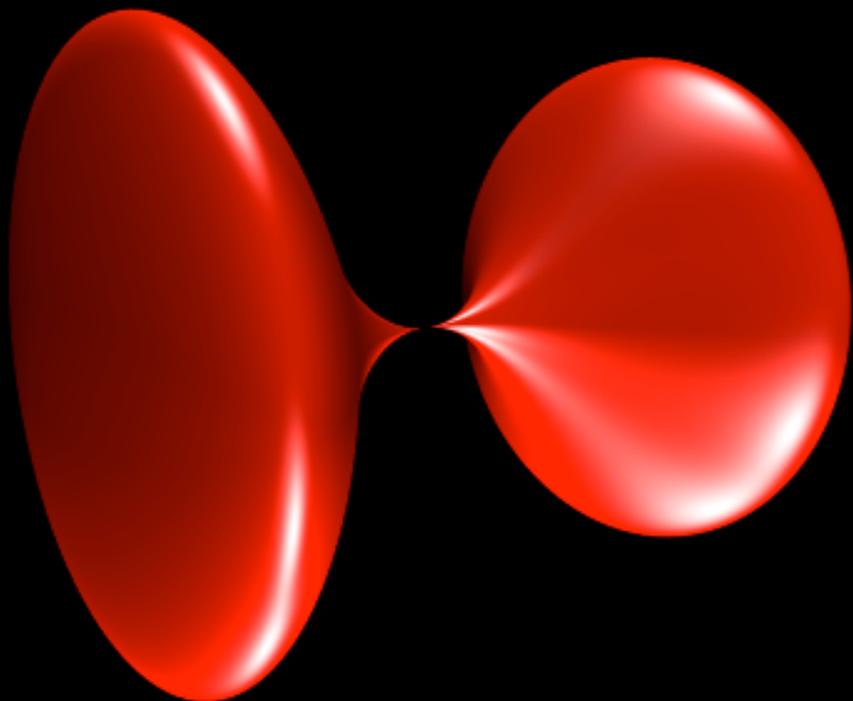

$$\int \int \int_B \text{div}(F) dV = \int \int_S F \cdot dS$$

Identities

- $\text{div}(\text{curl}(\mathbf{F}))=0$
- $\text{curl}(\text{grad}(f))=0$

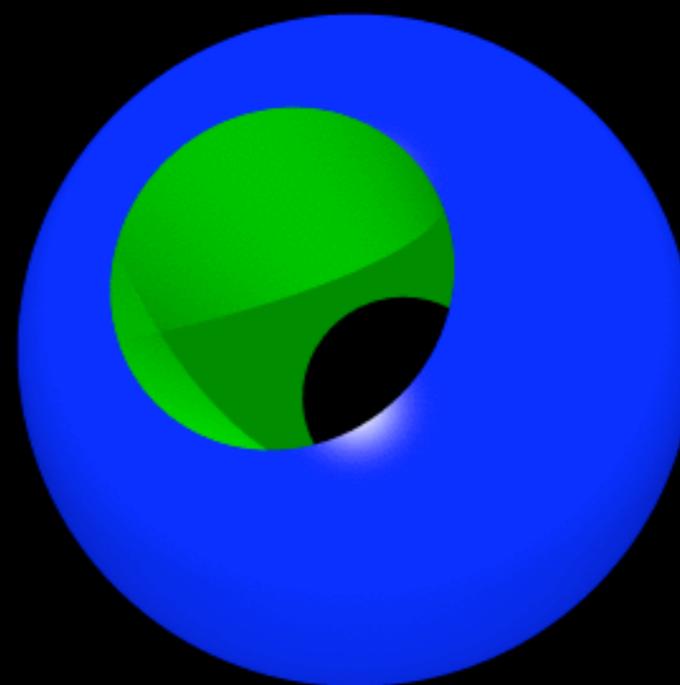

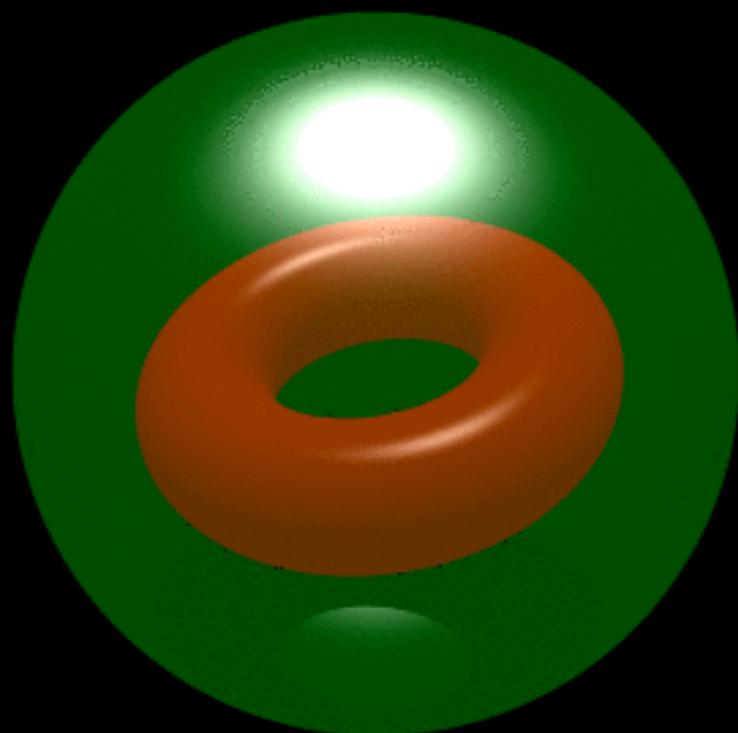

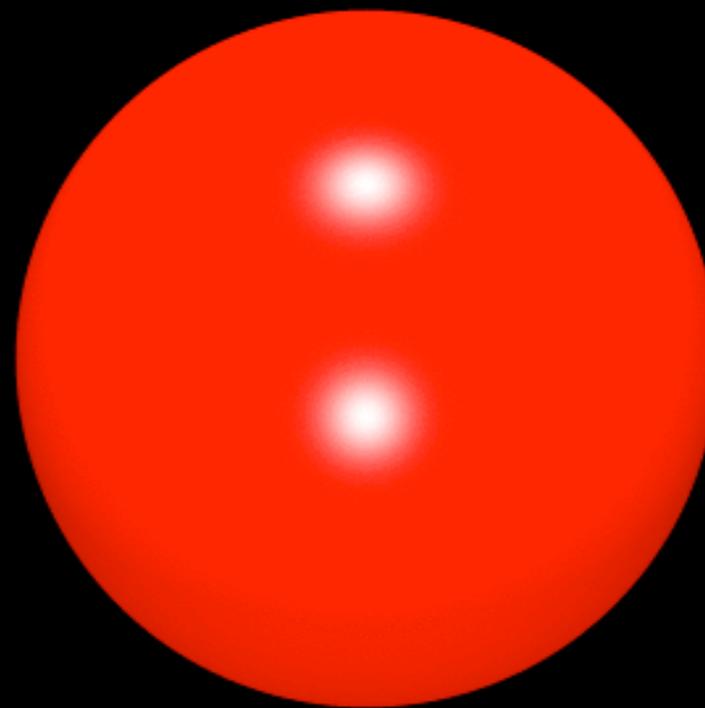

The line integral of $\mathbf{F}=\text{grad}(f)$ along a closed curve is zero.
(Either Stokes or fundamental Theorem of Line integrals)

The flux of $\mathbf{F}=\text{curl}(\mathbf{G})$ through a closed surface is zero.
(Either Divergence theorem or Stokes Theorem)

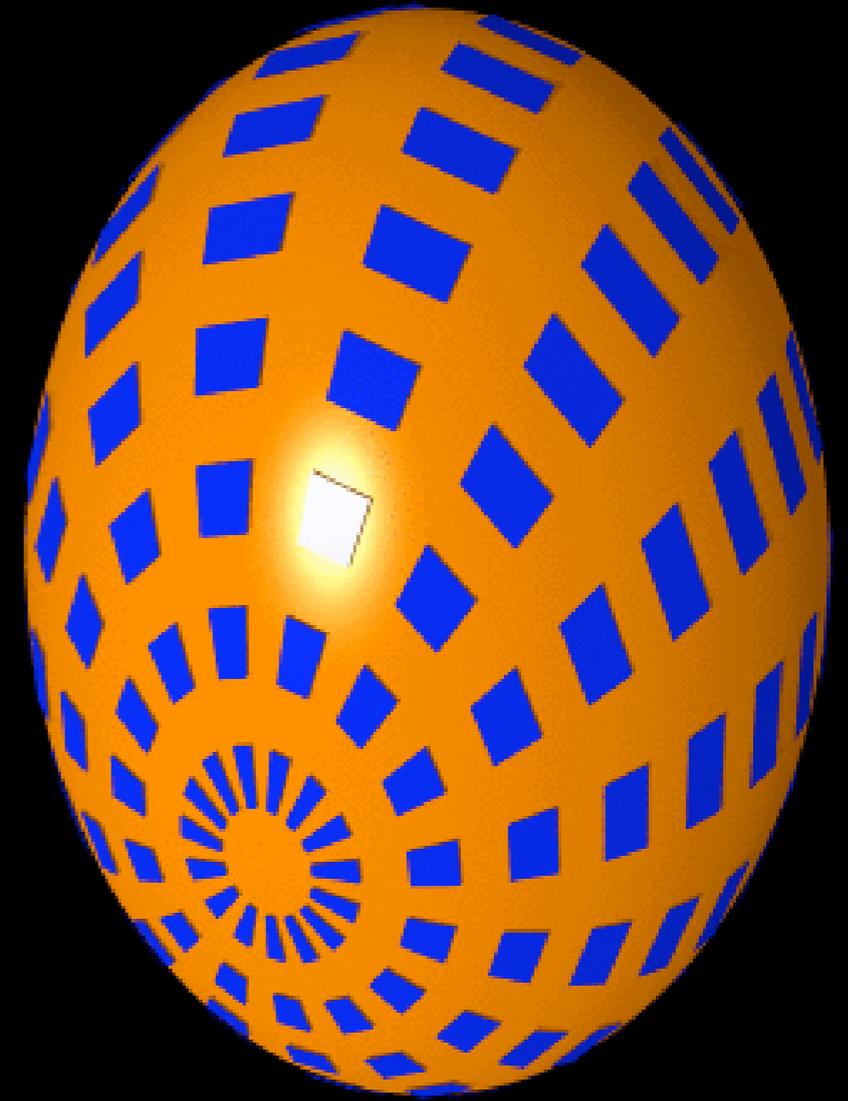

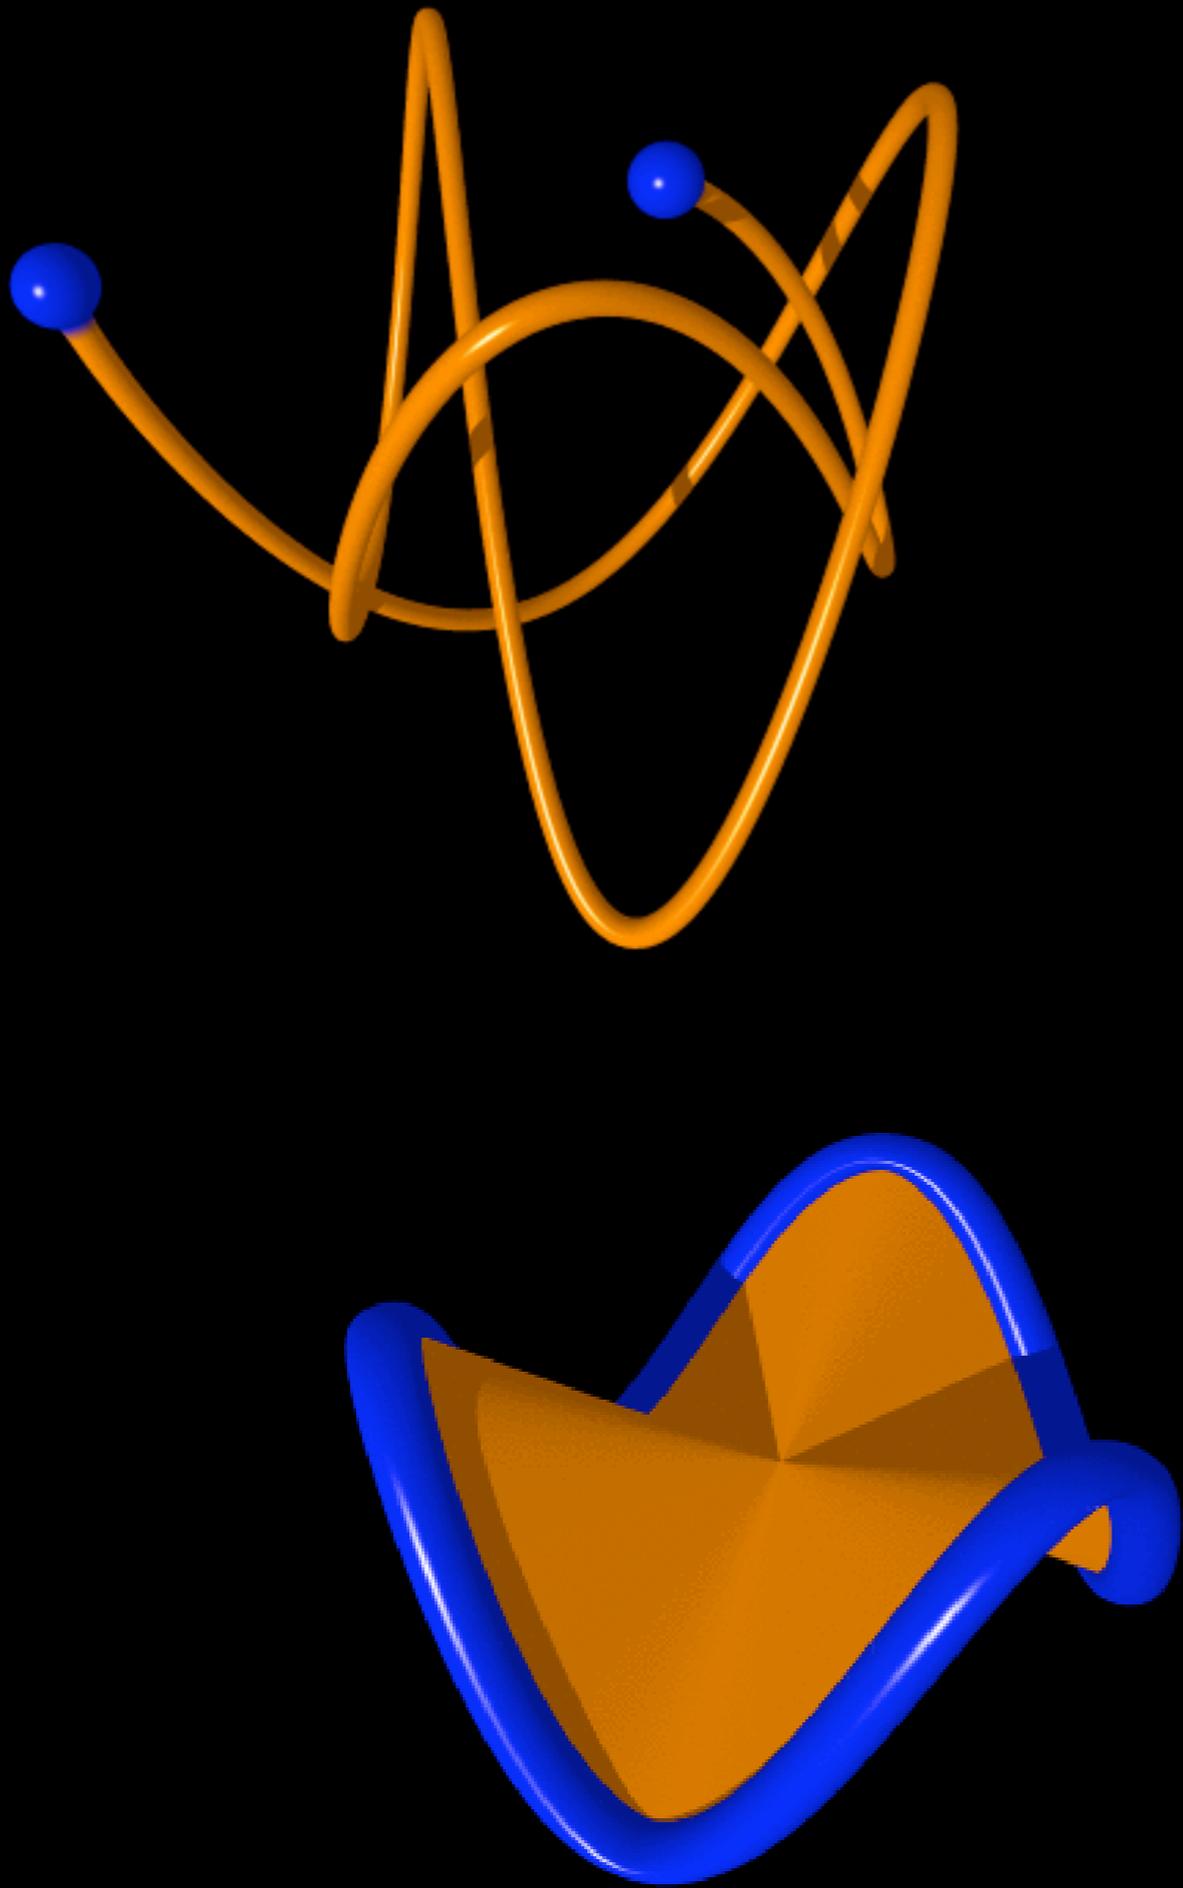

Simply connected

Simply connected ?

Boundary

That's all Folks!
